Important Information

Warranty
The media on which you receive National Instruments software are warranted not to fail to execute programming instructions, due to defects in materials and workmanship, for a period of 90 days from date of shipment, as evidenced by receipts or other documentation. National Instruments will, at its option, repair or replace software media that do not execute programming instructions if National Instruments receives notice of such defects during the warranty period. National Instruments does not warrant that the operation of the software shall be uninterrupted or error free.

A Return Material Authorization (RMA) number must be obtained from the factory and clearly marked on the outside of the package before any equipment will be accepted for warranty work. National Instruments will pay the shipping costs of returning to the owner parts which are covered by warranty.

National Instruments believes that the information in this document is accurate. The document has been carefully reviewed for technical accuracy. In the event that technical or typographical errors exist, National Instruments reserves the right to make changes to subsequent editions of this document without prior notice to holders of this edition. The reader should consult National Instruments if errors are suspected. In no event shall National Instruments be liable for any damages arising out of or related to this document or the information contained in it.

EXCEPT AS SPECIFIED HEREIN, NATIONAL INSTRUMENTS MAKES NO WARRANTIES, EXPRESS OR IMPLIED, AND SPECIFICALLY DISCLAIMS ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. CUSTOMER'S RIGHT TO RECOVER DAMAGES CAUSED BY FAULT OR NEGLIGENCE ON THE PART OF NATIONAL INSTRUMENTS SHALL BE LIMITED TO THE AMOUNT THEREFORE PAID BY THE CUSTOMER. NATIONAL INSTRUMENTS WILL NOT BE LIABLE FOR DAMAGES RESULTING FROM LOSS OF DATA, PROFITS, USE OF PRODUCTS, OR INCIDENTAL OR CONSEQUENTIAL DAMAGES, EVEN IF ADVISED OF THE POSSIBILITY THEREOF. THIS LIMITATION OF THE LIABILITY OF NATIONAL INSTRUMENTS WILL APPLY REGARDLESS OF THE FORM OF ACTION, WHETHER IN CONTRACT OR TORT, INCLUDING NEGLIGENCE. ANY ACTION AGAINST NATIONAL INSTRUMENTS MUST BE BROUGHT WITHIN ONE YEAR AFTER THE CAUSE OF ACTION ACCURSES. NATIONAL INSTRUMENTS SHALL NOT BE LIABLE FOR ANY DELAY IN PERFORMANCE DUE TO CAUSES BEYOND ITS REASONABLE CONTROL.

The warranty provided herein does not cover damages, defects, malfunctions, or service failures caused by owner’s failure to follow the National Instruments installation, operation, or maintenance instructions; owner’s modification of the product; owner’s abuse, misuse, or negligent acts; and power failure or surges, fire, flood, accident, actions of third parties, or other events outside reasonable control.

Copyright
Under the copyright laws, this publication may not be reproduced or transmitted in any form, electronic or mechanical, including photocopying, recording, storing in an information retrieval system, or translating, in whole or in part, without the prior written consent of National Instruments Corporation.

National Instruments respects the intellectual property of others, and we ask our users to do the same. NI software is protected by copyright and other intellectual property laws. Where NI software may be used to reproduce software or other materials belonging to others, you may use NI software only to reproduce materials that you may reproduce in accordance with the terms of any applicable license or other legal restriction.

Trademarks
CVI, National Instruments, NI, ni.com, the National Instruments corporate logo, and the Eagle logo are trademarks of National Instruments Corporation. Refer to the Trademark Information at ni.com/trademarks for other National Instruments trademarks.

The mark LabWindows is used under a license from Microsoft Corporation. Windows is a registered trademark of Microsoft Corporation in the United States and other countries. Other product and company names mentioned herein are trademarks or trade names of their respective companies.

Members of the National Instruments Alliance Partner Program are business entities independent from National Instruments and have no agency, partnership, or joint-venture relationship with National Instruments.

Patents
For patents covering National Instruments products/technology, refer to the appropriate location: Help»Patents in your software, the patents.txt file on your media, or the National Instruments Patent Notice at ni.com/patents.

Export Compliance Information
Refer to the Export Compliance Information at ni.com/legal/export-compliance for the National Instruments global trade compliance policy and how to obtain relevant HTS codes, ECCNs, and other import/export data.

WARNING REGARDING USE OF NATIONAL INSTRUMENTS PRODUCTS

(1) NATIONAL INSTRUMENTS PRODUCTS ARE NOT DESIGNED WITH COMPONENTS AND TESTING FOR A LEVEL OF RELIABILITY SUITABLE FOR USE IN OR IN CONNECTION WITH SURGICAL IMPLANTS OR AS CRITICAL COMPONENTS IN ANY LIFE SUPPORT SYSTEMS WHOSE FAILURE TO PERFORM CAN REASONABLY BE EXPECTED TO CAUSE SIGNIFICANT INJURY TO A HUMAN.

(2) IN ANY APPLICATION, INCLUDING THE ABOVE, RELIABILITY OF OPERATION OF THE SOFTWARE PRODUCTS CAN BE IMPAIRED BY ADVERSE FACTORS, INCLUDING BUT NOT LIMITED TO FLUCTUATIONS IN ELECTRICAL POWER SUPPLY, COMPUTER HARDWARE MALFUNCTIONS, COMPUTER OPERATING SYSTEM SOFTWARE FITNESSES, FITNESSES OF COMPILERS AND DEVELOPMENT SOFTWARE USED TO DEVELOP AN APPLICATION, INSTALLATION ERRORS, SOFTWARE AND HARDWARE COMPATIBILITY PROBLEMS, MALFUNCTIONS OR FAILURES OF ELECTRONIC MONITORING OR CONTROL DEVICES, TRANSPORT FAILURES OF ELECTRONIC SYSTEMS (HARDWARE AND/OR SOFTWARE), UNANTICIPATED USES OR MISUSES, OR ERRORS ON THE PART OF THE USER OR APPLICATION DESIGNER. (ADVERSE FACTORS SUCH AS THESE ARE HEREAFETER COLLECTIVELY TERMED “SYSTEM FAILURES”). ANY APPLICATION WHERE A SYSTEM FAILURE WOULD CREATE A RISK OF HARM TO PROPERTY OR PERSONS (INCLUDING THE RISK OF BODILY INJURY AND DEATH) SHOULD NOT BE RELIANT SOLELY UPON ONE FORM OF ELECTRONIC SYSTEM DUE TO THE RISK OF SYSTEM FAILURE. TO AVOID DAMAGE, INJURY, OR DEATH, THE USER OR APPLICATION DESIGNER MUST TAKE REASONABLY PRUDENT STEPS TO PROTECT AGAINST SYSTEM FAILURES, INCLUDING BUT NOT LIMITED TO BACK-UP OR SHUT DOWN MECHANISMS. BECAUSE EACH END-USER SYSTEM IS CUSTOMIZED AND DIFFERS FROM NATIONAL INSTRUMENTS TESTING PLATFORMS AND BECAUSE A USER OR APPLICATION DESIGNER MAY USE NATIONAL INSTRUMENTS PRODUCTS IN COMBINATION WITH OTHER PRODUCTS IN A MANNER NOT EVALUATED OR CONTEMPLATED BY NATIONAL INSTRUMENTS, THE USER OR APPLICATION DESIGNER IS ULTIMATELY RESPONSIBLE FOR VERIFYING AND VALIDATING THE SUITABILITY OF NATIONAL INSTRUMENTS PRODUCTS WHENEVER NATIONAL INSTRUMENTS PRODUCTS ARE INCORPORATED IN A SYSTEM OR APPLICATION, INCLUDING, WITHOUT LIMITATION, THE APPROPRIATE DESIGN, PROCESS AND SAFETY LEVEL OF SUCH SYSTEM OR APPLICATION.

Index
About This Manual

This manual provides instructions for using the Automotive Diagnostic Command Set. It contains information about installation, configuration, and troubleshooting, and also contains Automotive Diagnostic Command Set function reference for LabVIEW-based and C-based APIs.

Conventions

The following conventions appear in this manual:

» The » symbol leads you through nested menu items and dialog box options to a final action. The sequence File » Page Setup » Options directs you to pull down the File menu, select the Page Setup item, and select Options from the last dialog box.

⚠️ This icon denotes a note, which alerts you to important information.

**bold** Bold text denotes items that you must select or click in the software, such as menu items and dialog box options. Bold text also denotes parameter names.

*italic* Italic text denotes variables, emphasis, a cross-reference, or an introduction to a key concept. Italic text also denotes text that is a placeholder for a word or value that you must supply.

`monospace` Text in this font denotes text or characters that you should enter from the keyboard, sections of code, programming examples, and syntax examples. This font is also used for the proper names of disk drives, paths, directories, programs, subprograms, subroutines, device names, functions, operations, variables, filenames, and extensions.

`monospace italic` Italic text in this font denotes text that is a placeholder for a word or value that you must supply.
Related Documentation

The following documents contain information that you might find helpful as you read this manual:

- **CiA Draft Standard 102, Version 2.0, CAN Physical Layer for Industrial Applications**
- **ISO 14229:1998(E), Road Vehicles, Diagnostic Systems, Diagnostic Services Specification**

- **ISO 15765-2:2004(E), Road Vehicles, Diagnostics on Controller Area Networks (CAN), Part 2: Network Layer Services**
- **ISO 15765-3:2004(E), Road Vehicles, Diagnostics on Controller Area Networks (CAN), Part 3: Implementation of Unified Diagnostic Services (UDS on CAN)**
- **NI-CAN Hardware and Software Manual**
Activating Your Software

This section describes how to use the NI Activation Wizard to activate your software.

How Do I Activate My Software?

Use the NI Activation Wizard to obtain an activation code for your software. You can launch the NI Activation Wizard two ways:

- Launch the product and choose to activate your software from the list of options presented.
- Launch NI License Manager by selecting Start»All Programs»National Instruments»NI License Manager. Click the Activate button in the toolbar.

Notes  If your software is a part of a Volume License Agreement (VLA), contact your VLA administrator for installation and activation instructions.

NI software for Mac OS X and Linux operating systems does not require activation.

What is Activation?

Activation is the process of obtaining an activation code to enable your software to run on your computer. An activation code is an alphanumeric string that verifies the software, version, and computer ID to enable features on your computer. Activation codes are unique and are valid on only one computer.

What is the NI Activation Wizard?

The NI Activation Wizard is a part of NI License Manager that steps you through the process of enabling software to run on your machine.
Activating Your Software

What Information Do I Need to Activate?

You need your product serial number, user name, and organization. The NI Activation Wizard determines the rest of the information. Certain activation methods may require additional information for delivery. This information is used only to activate your product. Complete disclosure of the National Instruments software licensing information privacy policy is available at ni.com/activate/privacy. If you optionally choose to register your software, your information is protected under the National Instruments privacy policy, available at ni.com/privacy.

How Do I Find My Product Serial Number?

Your serial number uniquely identifies your purchase of NI software. You can find your serial number on the Certificate of Ownership included in your software kit. If your software kit does not include a Certificate of Ownership, you can find your serial number on the product packing slip or on the shipping label.

If you have installed a previous version using your serial number, you can find the serial number by selecting the Help»About menu item within the application or by selecting your product within NI License Manager (Start»All Programs»National Instruments»NI License Manager).

You can also contact your local National Instruments branch.

What is a Computer ID?

The computer ID contains unique information about your computer. National Instruments requires this information to enable your software. You can find your computer ID through the NI Activation Wizard or by using NI License Manager, as follows:

1. Launch NI License Manager by selecting Start»All Programs»National Instruments»NI License Manager.
2. Click the Display Computer Information button in the toolbar.

For more information about product activation and licensing, refer to ni.com/activate.
How Can I Evaluate NI Software?

You can install and run most NI application software in evaluation mode. This mode lets you use a product with certain limitations, such as reduced functionality or limited execution time. Refer to your product documentation for specific information on the product’s evaluation mode.

Moving Software After Activation

To transfer your software to another computer, install and activate it on the second computer. You are not prohibited from transferring your software from one computer to another and you do not need to contact or inform NI of the transfer. Because activation codes are unique to each computer, you will need a new activation code. Refer to How Do I Activate My Software? to acquire a new activation code and reactivate your software.

Deactivating a Product

To deactivate a product and return the product to the state it was in before you activated it, right-click the product in the NI License Manager tree and select Deactivate. If the product was in evaluation mode before you activated it, the properties of the evaluation mode may not be restored.

Using Windows Guest Accounts

NI License Manager does not support Microsoft Windows Guest accounts. You must log in to a non-Guest account to run licensed NI application software.
Introduction

Diagnostics involve remote execution of routines, or services, on ECUs. To execute a routine, you send a byte string as a request to an ECU, and the ECU usually answers with a response byte string. Several diagnostic protocols such as KWP2000 and UDS standardize the format of the services to be executed, but those standards leave a large amount of room for manufacturer-specific extensions. A newer trend is the emission-related legislated OnBoard Diagnostics (OBD), which is manufacturer independent and standardized in SAE J1979 and ISO 15031-5. This standard adds another set of services that follow the same scheme.

Because diagnostics were traditionally executed on serial communication links, the byte string length is not limited. For newer, CAN-based diagnostics, this involves using a transport protocol that segments the arbitrarily long byte strings into pieces that can be transferred over the CAN bus, and reassembles them on the receiver side. Several transport protocols accomplish this task. The Automotive Diagnostic Command Set implements the ISO TP (standardized in ISO 15765-2) and the manufacturer-specific VW TP 2.0.

Note The Automotive Diagnostic Command Set is designed for CAN-based diagnostics only. Diagnostics on serial lines (K-line and L-line) are not in the scope of the Automotive Diagnostic Command Set.

KWP2000 (Key Word Protocol 2000)

The KWP2000 protocol has become a de facto standard in automotive diagnostic applications. It is standardized as ISO 14230-3. KWP2000 describes the implementation of various diagnostic services you can access through the protocol. You can run KWP2000 on several transport layers such as K-line (serial) or CAN.
Transport Protocol

As KWP2000 uses messages of variable byte lengths, a transport protocol is necessary on layers with only a well defined (short) message length, such as CAN. The transport protocol splits a long KWP2000 message into pieces that can be transferred over the network and reassembles those pieces to recover the original message.

KWP2000 runs on CAN on various transport protocols such as ISO TP (ISO 15765-2), TP 1.6, TP 2.0 (Volkswagen), SAE J1939-21, and Diagnostic Over IP (ISO 13400).

Note For KWP2000, the Automotive Diagnostic Command Set supports only the ISO TP (standardized in ISO 15765-2), manufacturer-specific VW TP 2.0 transport protocols, and Diagnostic Over IP (ISO 13400).

Diagnostic Services

The diagnostic services available in KWP2000 are grouped in functional units and identified by a one-byte code (ServiceId). The standard does not define all codes; for some codes, the standard refers to other SAE or ISO standards, and some are reserved for manufacturer-specific extensions. The Automotive Diagnostic Command Set supports the following services:

• Diagnostic Management
• Data Transmission
• Stored Data Transmission (Diagnostic Trouble Codes)
• Input/Output Control
• Remote Activation of Routine

Note Upload/Download and Extended services are not part of the Automotive Diagnostic Command Set.

Diagnostic Service Format

Diagnostic services have a common message format. Each service defines a Request Message, Positive Response Message, and Negative Response Message.

The Request Message has the ServiceId as first byte, plus additional service-defined parameters. The Positive Response Message has an echo of the ServiceId with bit 6 set as first byte, plus the service-defined response parameters.
The Negative Response Message is usually a three-byte message: it has the Negative Response ServiceId as first byte, an echo of the original ServiceId as second byte, and a ResponseCode as third byte. The only exception to this format is the negative response to an EscapeCode service; here, the third byte is an echo of the user-defined service code, and the fourth byte is the ResponseCode. The KWP2000 standard partly defines the ResponseCodes, but there is room left for manufacturer-specific extensions. For some of the ResponseCodes, KWP2000 defines an error handling procedure. Because both positive and negative responses have an echo of the requested service, you can always assign the responses to their corresponding request.

**Connect/Disconnect**

KWP2000 expects a diagnostic session to be started with StartDiagnosticSession and terminated with StopDiagnosticSession. However, StartDiagnosticSession has a DiagnosticMode parameter that determines the diagnostic session type. Depending on this type, the ECU may or may not support other diagnostic services, or operate in a restricted mode where not all ECU functions are available. The DiagnosticMode parameter values are manufacturer specific and not defined in the standard.

For a diagnostic session to remain active, it must execute the TesterPresent service periodically if no other service is executed. If the TesterPresent service is missing for a certain period of time, the diagnostic session is terminated, and the ECU returns to normal operation mode.

**GetSeed/Unlock**

A GetSeed/Unlock mechanism may protect some diagnostic services. However, the applicable services are left to the manufacturer and not defined by the standard.

You can execute the GetSeed/Unlock mechanism through the SecurityAccess service. This defines several levels of security, but the manufacturer assigns these levels to certain services.

**Read/Write Memory**

Use the Read/WriteMemoryByAddress services to upload/download data to certain memory addresses on an ECU. The address is a three-byte quantity in KWP2000 and a five-byte quantity (four-byte address and one-byte extension) in the calibration protocols.
The Upload/Download functional unit services are highly manufacturer specific and not well defined in the standard, so they are not a good way to provide a general upload/download mechanism.

**Measurements**

Use the ReadDataByLocal/CommonIdentifier services to access ECU data in a way similar to a DAQ list. A Local/CommonIdentifier describes a list of ECU quantities that are then transferred from the ECU to the tester. The transfer can be either single value or periodic, with a slow, medium, or fast transfer rate. The transfer rates are manufacturer specific; you can use the SetDataRates service to set them, but this setting is manufacturer specific.

**Note** The Automotive Diagnostic Command Set supports single-point measurements.

**Diagnostic Trouble Codes**

A major diagnostic feature is the readout of Diagnostic Trouble Codes (DTCs). KWP2000 defines several services that access DTCs based on their group or status.

**Input/Output Control**

KWP2000 defines services to modify internal or external ECU signals. One example is redirecting ECU sensor inputs to stimulated signals. The control parameters of these commands are manufacturer specific and not defined in the standard.

**Remote Activation of a Routine**

These services are similar to the ActionService and DiagService functions of CCP. You can invoke an ECU internal routine identified by a Local/CommonIdentifier or a memory address. Contrary to the CCP case, execution of this routine can be asynchronous; that is, there are separate Start, Stop, and RequestResult services.

The control parameters of these commands are manufacturer specific and not defined in the standard.

**External References**

For more information about the KWP2000 Standard, refer to the ISO 14230-3 standard.
UDS (Unified Diagnostic Services)

The UDS protocol has become a de facto standard in automotive diagnostic applications. It is standardized as ISO 15765-3. UDS describes the implementation of various diagnostic services you can access through the protocol.

As UDS uses messages of variable byte lengths, a transport protocol is necessary on layers with only a well defined (short) message length, such as CAN. The transport protocol splits a long UDS message into pieces that can be transferred over the network and reassembles those pieces to recover the original message.

UDS runs on CAN and Ethernet on various transport protocols.

Note The Automotive Diagnostic Command Set supports only the ISO TP (standardized in ISO 15765-2), manufacturer-specific VW TP 2.0 transport protocols, and Diagnostic Over IP (ISO 13400).

Diagnostic Services

The diagnostic services available in UDS are grouped in functional units and identified by a one-byte code (ServiceId). Not all codes are defined in the standard; for some codes, the standard refers to other standards, and some are reserved for manufacturer-specific extensions. The Automotive Diagnostic Command Set supports the following services:

- Diagnostic Management
- Data Transmission
- Stored Data Transmission (Diagnostic Trouble Codes)
- Input/Output Control
- Remote Activation of Routine

Diagnostic Service Format

Diagnostic services have a common message format. Each service defines a Request Message, a Positive Response Message, and a Negative Response Message. The general format of the diagnostic services complies with the KWP2000 definition; most of the ServiceIds also comply with KWP2000. The Request Message has the ServiceId as first byte, plus additional service-defined parameters. The Positive Response Message has an echo of the ServiceId with bit 6 set as first byte, plus the service-defined response parameters.
Note Some parameters to both the Request and Positive Response Messages are optional. Each service defines these parameters. Also, the standard does not define all parameters.

The Negative Response Message is usually a three-byte message: it has the Negative Response ServiceId (0x7F) as first byte, an echo of the original ServiceId as second byte, and a ResponseCode as third byte. The UDS standard partly defines the ResponseCodes, but there is room left for manufacturer-specific extensions. For some of the ResponseCodes, UDS defines an error handling procedure.

Because both positive and negative responses have an echo of the requested service, you always can assign the responses to their corresponding request.

External References

For more information about the UDS Standard, refer to the ISO 15765-3 standard.

OBD (On-Board Diagnostic)

On-Board Diagnostic (OBD) systems are present in most cars and light trucks on the road today. On-Board Diagnostics refer to the vehicle’s self-diagnostic and reporting capability, which the vehicle owner or a repair technician can use to query status information for various vehicle subsystems.

The amount of diagnostic information available via OBD has increased since the introduction of on-board vehicle computers in the early 1980s. Modern OBD implementations use a CAN communication port to provide real-time data and a standardized series of diagnostic trouble codes (DTCs), which identify and remedy malfunctions within the vehicle. In the 1970s and early 1980s, manufacturers began using electronic means to control engine functions and diagnose engine problems. This was primarily to meet EPA emission standards. Through the years, on-board diagnostic systems have become more sophisticated. OBD-II, a new standard introduced in the mid 1990s, provides almost complete engine control and also monitors parts of the chassis, body, and accessory devices, as well as the car’s diagnostic control network.

The On-Board Diagnostic (OBD) standard defines a minimum set of diagnostic information for passenger cars and light and medium-duty trucks, which must be exchanged with any off-board test equipment.
Installation and Configuration

This chapter explains how to install and configure the Automotive Diagnostic Command Set.

Installation

This section discusses the Automotive Diagnostic Command Set installation for Microsoft Windows.

Note You need administrator rights to install the Automotive Diagnostic Command Set on your computer.

Follow these steps to install the Automotive Diagnostic Command Set software:

1. Insert the Automotive Diagnostic Command Set CD into the CD-ROM drive.
2. Open Windows Explorer.
3. Access the CD-ROM drive.
4. Double-click on autorun.exe to launch the software interface.
5. Start the installation. The installation program guides you through the rest of the installation process.
6. If you have not already installed NI-CAN, the Automotive Diagnostic Command Set installer automatically installs the NI-CAN driver on your computer.

Within the Devices & Interfaces branch of the MAX Configuration tree, NI CAN hardware is listed along with other hardware in the local computer system. If the CAN hardware is not listed here, MAX is not configured to search for new devices on startup. To search for the new hardware, press <F5>. To verify installation of the CAN hardware, right-click the CAN device, then select Self-test. If the self-test passes, the card icon shows a checkmark. If the self-test fails, the card icon shows an X mark, and the Test Status in the right pane describes the problem.
Refer to Appendix A, Troubleshooting and Common Questions, of the NI-CAN User Manual for information about resolving hardware installation problems.

If you are using the Automotive Diagnostic Command Set on an NI-XNET device, install the NI-XNET driver 1.0 or higher, NI-CAN 2.7 or higher, and the NI-CAN Compatibility Library on your computer.

The MAX Configuration tree Devices and Interfaces branch lists NI-XNET hardware (along with other local computer system hardware). If the NI-XNET hardware is not listed there, MAX is not configured to search for new devices on startup. To search for the new hardware, press <F5>. To verify CAN hardware installation, right-click the CAN device and select Self-Test. If the self-test passes, the card icon shows a checkmark. If the self-test fails, the card icon shows an X mark, and the Test Status in the right pane describes the problem. Refer to Chapter 6, Troubleshooting and Common Questions, of the NI-XNET User Manual for information about resolving hardware installation problems. The NI-XNET CAN hardware interfaces are listed under the device name. To change the interface name, select a new one from the Interface Name box in the middle pane.

When installation is complete, you can access the Automotive Diagnostic Command Set functions in your application development environment.

LabVIEW Real-Time (RT) Configuration

LabVIEW Real-Time (RT) combines easy-to-use LabVIEW programming with the power of real-time systems. When you use a National Instruments PXI controller as a LabVIEW RT system, you can install a PXI CAN card and use the NI-CAN or NI-XNET APIs to develop real-time applications. As with any NI software library for LabVIEW RT, you must install the Automotive Diagnostic Command Set software to the LabVIEW RT target using the Remote Systems branch in MAX. For more information, refer to the LabVIEW RT documentation.

After you install the PXI CAN cards and download the Automotive Diagnostic Command Set software to the LabVIEW RT system, you must verify the installation.
Hardware and Software Requirements

You can use the Automotive Diagnostic Command Set on the following hardware:

- National Instruments NI-CAN hardware Series 1 or 2 with the NI-CAN driver software version 2.3 or later installed.
- National Instruments NI-XNET hardware with the NI-XNET driver software version 1.0 or later installed.
- National Instruments CompactRIO or R Series Multifunction RIO hardware and the NI 9853 or NI 9852 CompactRIO CAN modules.

**Note**  You can use the Automotive Diagnostic Command Set with LabVIEW 2009 or newer on CompactRIO systems or National Instruments R Series Multifunction RIO hardware.
Application Development

This chapter explains how to develop an application using the Automotive Diagnostic Command Set API.

Choosing the Programming Language

The programming language you use for application development determines how to access the Automotive Diagnostic Command Set APIs.

LabVIEW

Automotive Diagnostic Command Set functions and controls are in the LabVIEW palettes. In LabVIEW, the Automotive Diagnostic Command Set palette is in the top-level NI Measurements palette.

Chapter 5, *Automotive Diagnostic Command Set API for LabVIEW*, describes each LabVIEW VI for the Automotive Diagnostic Command Set API.

To access the VI reference from within LabVIEW, press <Ctrl-H> to open the Help window, click the appropriate Automotive Diagnostic Command Set VI, and follow the link. The Automotive Diagnostic Command Set software includes a full set of LabVIEW examples. These examples teach programming basics as well as advanced topics. The example help describes each example and includes a link you can use to open the VI.

LabWindows/CVI

Within LabWindows™/CVI™, the Automotive Diagnostic Command Set function panel is in Libraries>Automotive Diagnostic Command Set. As with other LabWindows/CVI function panels, the Automotive Diagnostic Command Set function panel provides help for each function and the ability to generate code. Chapter 6, *Automotive Diagnostic Command Set API for C*, describes each Automotive Diagnostic Command Set API function. You can access the reference for each function directly from within the function panel. The Automotive Diagnostic Command Set API header file is nidiagcs.h. The Automotive Diagnostic Command Set API library is nidiagcs.lib. The toolkit software includes a full set of
LabWindows/CVI examples. The examples are in the LabWindows/CVI \samples\Automotive Diagnostic Command Set directory. Each example includes a complete LabWindows/CVI project (.prj file). The example description is in comments at the top of the .c file.

Visual C++ 6

The Automotive Diagnostic Command Set software supports Microsoft Visual C/C++ 6.

The header file for Visual C/C++ 6 is in the Program Files\National Instruments\Shared\ExternalCompilerSupport\C\include folder. To use the Automotive Diagnostic Command Set API, include the nidiags.h header file in the code, then link with the nidiagcs.lib library file. The library file is in the Program Files\National Instruments\Shared\ExternalCompilerSupport\C\lib32\msvc folder.

For C applications (files with a .c extension), include the header file by adding a #include to the beginning of the code, as follows:
#include "nidiagcs.h"

For C++ applications (files with a .cpp extension), define __cplusplus before including the header, as follows:
#define __cplusplus
#include "nidiagcs.h"

The __cplusplus define enables the transition from C++ to the C language functions.

Chapter 6, Automotive Diagnostic Command Set API for C, describes each function.

On Windows Vista (with Standard User Account), the typical path to the C examples folder is \Users\Public\Documents\National Instruments\Automotive Diagnostic Command Set\ Examples\ MS Visual C.

On Windows XP/2000, the typical path to the C examples folder is \Documents and Settings\All Users\Documents\National Instruments\Automotive Diagnostic Command Set\ Examples\ MS Visual C.
Each example is in a separate folder. The example description is in comments at the top of the .c file. At the command prompt, after setting MSVC environment variables (such as with MS vcvars32.bat), you can build each example using a command such as:

c1 /I<HDir> GetDTCs.c <LibDir>

<HDir> is the folder where nidiagcs.h can be found.

<LibDir> is the folder where nidiagcs.lib can be found.

**Other Programming Languages**

The Automotive Diagnostic Command Set software does not provide formal support for programming languages other than those described in the preceding sections. If the programming language includes a mechanism to call a Dynamic Link Library (DLL), you can create code to call Automotive Diagnostic Command Set functions. All functions for the Automotive Diagnostic Command Set API are in nidiagcs.dll. If the programming language supports the Microsoft Win32 APIs, you can load pointers to Automotive Diagnostic Command Set functions in the application. The following section describes how to use the Win32 functions for C/C++ environments other than Visual C/C++ 6. For more detailed information, refer to Microsoft documentation.

The following C language code fragment shows how to call Win32 LoadLibrary to load the Automotive Diagnostic Command Set API DLL:

```c
#include <windows.h>
#include "nidiagcs.h"
HINSTANCE NiDiagCSLib = NULL;
NiMcLib = LoadLibrary("nidiagcs.dll");
```

Next, the application must call the Win32 GetProcAddress function to obtain a pointer to each Automotive Diagnostic Command Set function the application uses. For each function, you must declare a pointer variable using the prototype of the function. For the Automotive Diagnostic Command Set function prototypes, refer to Chapter 6, *Automotive Diagnostic Command Set API for C*. Before exiting the application, you must unload the Automotive Diagnostic Command Set DLL as follows:

```c
FreeLibrary (NiDiagCSLib);
```
To run a project on an FPGA target with an NI 985x C Series module, you need an FPGA bitfile (.lvbitx). The FPGA bitfile is downloaded to the FPGA target on the execution host. A bitfile is a compiled version of an FPGA VI. FPGA VIs, and thus bitfiles, define the CAN, analog, digital, and pulse width modulation (PWM) inputs and outputs of an FPGA target. The Automotive Diagnostic Command Set does not include FPGA bitfiles for any FPGA target. Refer to the LabVIEW FPGA Module documentation for more information about creating FPGA VIs and bitfiles for an FPGA target.

The default FPGA VI is sufficient for a basic Automotive Diagnostic Command Set application. However, in some situations you may need to modify the existing FPGA code to create a custom bitfile. For example, to use additional I/O on the FPGA target, you must add these I/O to the FPGA VI. You must install the LabVIEW FPGA Module to create these files.

Modify the FPGA VI according to the following guidelines:

- Do not modify, remove, or rename any block diagram controls and indicators named __CAN0 Rx Data, __CAN0 Rx Ready, __CAN0 Tx Data Frame, __CAN0 Tx Ready, __CAN0 Bit Timing, __CAN0 FPGA Is Running, __CAN0 Start, __CAN0 FIFO Full, or __CAN0 FIFO Empty. If you intend to use multiple CAN 985x modules on your FPGA, you need to duplicate and rename all controls and indicators accordingly.

- Do not modify the CAN read and write code except to filter CAN IDs on the receiving side to minimize the amount of CAN data transfers to the host.

- As you create controls or indicators, ensure that each control name is unique within the VI.

Refer to the LabVIEW FPGA Module documentation for more information about creating FPGA VIs and bitfiles for an FPGA target.

When using ADCS on CompactRIO with an NI 985x C Series module, the interface name is based on the bitfile you use and the interface name you set. For example, MyInterface@MyBitfile.lvbitx, CAN0@lvbitfile.lvbitx, or CAN0@mybitfile.lvbitx.
The interface name you use must be part of all parameters in the FPGA code for the CAN communication. Also, the ADCS needs the interface name for correct functionality.

If you define the interface name to be CAN0, you must name the parameters as follows:

- __CAN0 Rx Data
- __CAN0 Rx Ready
- __CAN0 Tx Data Frame
- __CAN0 Tx Ready
- __CAN0 Bit Timing
- __CAN0 FPGA Is Running
- __CAN0 Start
- __CAN0 FIFO Full
- __CAN0 FIFO Ready

In addition, you need to set the name of the internally used FIFO to __CAN0 FIFO (the FIFO is set to U32, 1029 elements, target scoped, and block memory).

After recompiling your FPGA VI, copy the bitfile to the root directory of your CompactRIO controller and specify the bitfile in the interface name. Or copy the file to any location on the CompactRIO controller and specify an absolute path or path relative to the root for the bitfile.

If you are using an NI-XNET 986x C Series module on your CompactRIO target, you need to start an FPGA VI on the target before accessing the port with ADCS. Refer to the Getting Started with CompactRIO section in the NI-XNET Hardware and Software Manual for more information about compiling the FPGA VI. When the VI is running, you can access the NI 986x module as you would program on a Windows or PXI LabVIEW Real-Time target.
4

Using the Automotive Diagnostic Command Set

Structure of the Automotive Diagnostic Command Set

- Diagnostic Services Layer
  - KWP2000 Services
  - UDS (DiagOnCAN) Services
  - OBD(OnBoard Diag) Services
- Diagnostic Transport Layer
  - Connection Management
  - Service Execution
- Transport Protocols
  - ISO TP (ISO 15765-2)
  - VW TP 2.0
  - Diag Over IP (ISO 13400)
- CAN Layer (C++ DLL)
- Base Driver
  - NI-CAN
  - NI-XNET
  - NI-RIO
  - Ethernet
The Automotive Diagnostic Command Set is structured into three layers of functionality:

- The top layer implements three sets of diagnostic services for the diagnostic protocols KWP2000, UDS (DiagOnCAN), and OBD (On-Board Diagnostics).
- The second layer implements general routines involving opening and closing diagnostic communication connections, connecting and disconnecting to/from an ECU, and executing a diagnostic service on byte level. The latter routine is the one the top layer uses heavily.
- The third layer implements the transport protocols needed for diagnostic communication to an ECU. The second layer uses these routines to communicate to an ECU.

All three top layers are fully implemented in LabVIEW.

The transport protocols then execute CAN Read/Write operations through a specialized DLL for streamlining the CAN data flow, especially in higher busload situations.

**Automotive Diagnostic Command Set API Structure**

The top two layer routines are available as API functions. Each diagnostic service for KWP2000, UDS, and OBD is available as one routine. Also available on the top level are auxiliary routines for converting scaled physical data values to and from their binary representations used in the diagnostic services.

On the second layer are more general routines for opening and closing diagnostic communication channels and executing a diagnostic service. Auxiliary routines create the diagnostic CAN identifiers from the logical ECU address.
First, you must open a diagnostic communication link. This involves initializing the CAN port and defining communication parameters such as the baud rate and CAN identifiers on which the diagnostic communication takes place. No actual communication to the ECU takes place at this stage.

For the VW TP 2.0, you then must establish a communication channel to the ECU using the VWTP Connect routine. The communication channel properties are negotiated between the host and ECU.

After these steps, the diagnostic communication is established, and you can execute diagnostic services of your choice. Note that for the VW TP 2.0, you must execute the VWTP ConnectionTest routine periodically (once per second) to keep the communication channel open.
When you finish your diagnostic services, you must close the diagnostic communication link. This finally closes the CAN port. For the VW TP 2.0, you should disconnect the communication channel established before closing.

Available Diagnostic Services

The standards on automotive diagnostic define many different services for many purposes. Unfortunately, most services leave a large amount of room for manufacturer-specific variants and extensions. National Instruments implemented the most used variants while trying not to overload them with optional parameters.

However, all services are implemented in LabVIEW and open to the user. If you are missing a service or variant of an existing service, you can easily add or modify it on your own.

In the C API, you can also implement your own diagnostic services using the ndDiagnosticService routine. However, the templates from the existing services are not available.

Tweaking the Transport Protocol

A set of global constants controls transport protocol behavior. These constants default to maximum performance. To check the properties of an implementation of a transport protocol in an ECU, for example, you may want to change the constants to nonstandard values using the Get/Set Property routines.

The transport protocols also are fully implemented in LabVIEW and open to the user. In LabVIEW, you can even modify the protocol behavior (for example, you can send undefined responses to check the behavior of an implementation).

However, be sure to save the original routine versions to restore the original behavior.

In the C API, changing the global constants is the only way to modify the transport protocol.
Automotive Diagnostic Command Set API for LabVIEW

This chapter lists the LabVIEW VIs for the Automotive Diagnostic Command Set API and describes the format, purpose, and parameters for each VI. The VIs are listed alphabetically in four categories: general functions, KWP2000 services, UDS (DiagOnCAN) services, and OBD (On-Board Diagnostics) services.

Section Headings

The following are section headings found in the Automotive Diagnostic Command Set API for LabVIEW VIs.

Purpose

Each VI description briefly describes the VI purpose.

Format

The format section describes the VI format.

Input and Output

The input and output sections list the VI parameters.

Description

The description section gives details about the VI purpose and effect.
## List of VIs

The following table is an alphabetical list of the Automotive Diagnostic Command Set VIs.

<table>
<thead>
<tr>
<th>Function</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ClearDiagnosticInformation.vi</td>
<td>Executes the ClearDiagnosticInformation service and clears selected Diagnostic Trouble Codes (DTCs).</td>
</tr>
<tr>
<td>Close Diagnostic.vi</td>
<td>Closes a diagnostic session.</td>
</tr>
<tr>
<td>ControlDTCSetting.vi</td>
<td>Executes the ControlDTCSetting service and modifies the generation behavior of selected Diagnostic Trouble Codes (DTCs).</td>
</tr>
<tr>
<td>Convert from Phys.vi</td>
<td>Converts a physical data value into a binary representation using a type descriptor.</td>
</tr>
<tr>
<td>Convert to Phys.vi</td>
<td>Converts a binary representation of a value into its physical value using a type descriptor.</td>
</tr>
<tr>
<td>Create Extended CAN IDs.vi</td>
<td>Creates diagnostic CAN IDs according to ISO 15765-2.</td>
</tr>
<tr>
<td>Diag Get Property.vi</td>
<td>Gets a diagnostic global internal parameter.</td>
</tr>
<tr>
<td>Diag Set Property.vi</td>
<td>Sets a diagnostic global internal parameter.</td>
</tr>
<tr>
<td>Diagnostic Frame Recv.vi</td>
<td>Receives a raw CAN frame on the diagnostic CAN ID to check for errors in the transport protocol implementation of an ECU.</td>
</tr>
<tr>
<td>Diagnostic Frame Send.vi</td>
<td>Sends a raw CAN frame on the diagnostic CAN ID to check for errors in the transport protocol implementation of an ECU.</td>
</tr>
<tr>
<td>Diagnostic Service.vi</td>
<td>Executes a generic diagnostic service. If a special service is not available through the KWP2000, UDS, or OBD service functions, you can build it using this VI.</td>
</tr>
</tbody>
</table>
DisableNormalMessageTransmission.vi
Executes the DisableNormalMessageTransmission service. The ECU no longer transmits its regular communication messages (usually CAN messages).

DoIP Activate Routing.vi
Defines the source and target addresses for a DoIP TCP/IP connection.

DoIP Connect.vi
Creates a TCP/IP connection to a DoIP entity identified by its IP address.

DoIP Disconnect.vi
 Disconnects the TCP/IP connection to a DoIP entity.

DoIP Get Diagnostic Power Mode.vi
Gets information about the DoIP entity power state.

DoIP Get DoIP Entity Status.vi
Gets status information from a DoIP entity.

DoIP Get Entities.vi
Returns a table of all DoIP entities (vehicles) on the local subnet, possibly restricted to EID or VIN.

DoIP Send Vehicle Identification Request.vi
Sends a UDP request to all DoIP-capable vehicles in the local subnet to identify themselves.

DoIP Send Vehicle Identification Request w EID.vi
Sends a UDP request to all DoIP-capable vehicles with a certain EID (MAC address) in the local subnet to identify themselves.

DoIP Send Vehicle Identification Request w VIN.vi
Sends a UDP request to all DoIP-capable vehicles with a certain VIN (Vehicle Identification Number) in the local subnet to identify themselves.

DTC to String.vi
Returns a string representation (such as P1234) for a 2-byte Diagnostic Trouble Code (DTC).

ECUReset.vi
Executes the ECUReset service and resets the ECU.

</tbody>
</table>
General Functions

Close Diagnostic.vi

Purpose
Closes a diagnostic session.

Format

```
Input

    diag ref in  ------ DIAG
    error in (no error)  ------ error out

```

Input

diag ref in specifies the diagnostic session handle, obtained from Open Diagnostic.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
Output

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

Description

The diagnostic session specified by **diag ref in** is closed, and you can no longer use it for communication to an ECU. Note that this command does not communicate the closing to the ECU before terminating; if this is necessary, you must manually do so (for example, by calling **StopDiagnosticSession.vi**) before calling **Close Diagnostic.vi**.
Convert from Phys.vi

Purpose
Converts a physical data value into a binary representation using a type descriptor.

Format

<table>
<thead>
<tr>
<th>type descriptor</th>
<th>Start Byte</th>
<th>Byte Length</th>
<th>Byte Order</th>
<th>Data Type</th>
<th>Scale Factor</th>
<th>Scale Offset</th>
<th>value</th>
<th>data out</th>
</tr>
</thead>
</table>

Input

type descriptor is a cluster that specifies the conversion of the physical value to its binary representation:

- **Start Byte** gives the start byte of the binary representation. For Convert from Phys.vi, this value is ignored and always assumed to be 0.
- **Byte Length** is the binary representation byte length.
- **Byte Order** is the byte ordering of the data in the binary representation:
  - 0: MSB_FIRST (Motorola)
  - 1: LSB_FIRST (Intel)
- **Data Type** is the binary representation format:
  - 0: Unsigned. Only byte lengths of 1–4 are allowed.
  - 1: Signed. Only byte lengths of 1–4 are allowed.
  - 2: Float. Only byte lengths of 4 or 8 are allowed.
- **Scale Factor** defines the physical value scaling:
  - Phys = (Scale Factor) * (binary representation) + (Scale Offset)
- **Scale Offset** (refer to Scale Factor)

value is the physical value to be converted.
Output

data out is the binary representation of the physical value. If you build a record of multiple values, you can concatenate the outputs of several instances of Convert from Phys.vi.

Description

Data input to diagnostic services (for example, WriteDataByLocalIdentifier.vi) is usually a byte stream of binary data. If you have a description of the data input (for example, byte 3 and 4 are engine RPM scaled as .25 * × RPM in Motorola representation), you can use Convert from Phys.vi to convert the physical value to the byte stream by filling an appropriate type descriptor cluster.

Convert from Phys.vi converts only the portion specified by one type descriptor to a binary representation. If your data input consists of several values, you can use Convert from Phys.vi multiple times and concatenate their outputs.
Convert to Phys.vi

Purpose
Converts a binary representation of a value into its physical value using a type descriptor.

Format

```
<table>
<thead>
<tr>
<th>type descriptor</th>
<th>value</th>
</tr>
</thead>
</table>
```

Input

- **type descriptor** is a cluster that specifies the conversion of the binary representation to its physical value:
  - **Start Byte** gives the binary representation start byte in the **data in** record.
  - **Byte Length** is the binary representation byte length.
  - **Byte Order** is the byte ordering of the data in the binary representation:
    - 0: MSB_FIRST (Motorola)
    - 1: LSB_FIRST (Intel)
  - **Data Type** is the binary representation format:
    - 0: Unsigned. Only byte lengths of 1–4 are allowed.
    - 1: Signed. Only byte lengths of 1–4 are allowed.
    - 2: Float. Only byte lengths of 4 or 8 are allowed.
  - **Scale Factor** defines the physical value scaling:
    - Phys = (Scale Factor) * (binary representation) + (Scale Offset)
  - **Scale Offset** (refer to Scale Factor)
- **data in** is the data record from which physical values are to be extracted.
Output

value is the physical value extracted from the record.

Description

Data output from diagnostic services (for example, ReadDataByLocalIdentifier.vi) is usually a byte stream of binary data. If you have a description of the data output (for example, byte 3 and 4 are engine RPM scaled as .25 × RPM in Motorola representation), you can use Convert to Phys.vi to extract the physical value from the byte stream by filling an appropriate type descriptor cluster.
Create Extended CAN IDs.vi

Purpose

Creates diagnostic CAN IDs according to ISO 15765-2.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>addressing mode</strong></td>
<td><strong>transmit ID</strong></td>
</tr>
<tr>
<td><strong>transport protocol</strong></td>
<td><strong>receive ID</strong></td>
</tr>
<tr>
<td><strong>source address</strong></td>
<td></td>
</tr>
<tr>
<td><strong>target address</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Input**

- **addressing mode** specifies whether the ECU is physically or functionally addressed.
- **transport protocol** specifies whether normal or mixed mode addressing is used.
- **source address** is the logical address of the host (diagnostic tester).
- **target address** is the ECU logical address.

**Output**

- **transmit ID** is the generated CAN identifier for sending diagnostic request messages from the host to the ECU.
- **receive ID** is the generated CAN identifier for sending diagnostic response messages from the ECU to the host.

**Description**

ISO 15765-2 specifies a method (extended/29 bit) of creating CAN identifiers for diagnostic applications given the addressing mode (physical/functional), the transport protocol (normal/mixed), and the 8-bit source and target addresses. This VI implements the construction of these CAN identifiers. You can use them directly in Open Diagnostic.vi.
Diag Get Property.vi

Purpose

Gets a diagnostic global internal parameter.

Format

```
property ID  property value
error in (no error)  error out
```

Input

**property ID** defines the parameter whose value is to be retrieved. You can create the values using an Enum control.

0  **Timeout Diag Command** is the timeout in milliseconds the master waits for the response to a diagnostic request message. The default is 1000 ms.

1  **Timeout FC (Bs)** is the timeout in milliseconds the master waits for a Flow Control frame after sending a First Frame or the last Consecutive Frame of a block. The default is 250 ms.

2  **Timeout CF (Cr)** is the timeout in milliseconds the master waits for a Consecutive Frame in a multiframe response. The default is 250 ms.

3  **Receive Block Size (BS)** is the number of Consecutive Frames the slave sends in one block before waiting for the next Flow Control frame. A value of 0 (default) means all Consecutive Frames are sent in one run without interruption.

4  **Wait Time CF (STmin)** defines the minimum time for the slave to wait between sending two Consecutive Frames of a block. Values from 0 to 127 are wait times in milliseconds. Values 241 to 249 (Hex F1 to F9) mean wait times of 100 µs to 900 µs, respectively. All other values are reserved. The default is 5 ms.

5  **Max Wait Frames (N_WFTmax)** is the maximum number of WAIT frames the master accepts before terminating the connection. The default is 10.

6  **Wait Frames to Send (N_WAIT)** is the number of WAIT frames the master sends every time before a CTS frame is sent. If this value is
set to a negative number (for example, \texttt{0xFFFFFFFF} = \(-1\)), the 
master sends an OVERLOAD frame instead of a WAIT, and 
reception is aborted. The default is \(0\) for maximum speed.

7. **Time between Waits (T\_W)** is the number of milliseconds the 
master waits after sending a WAIT frame. The default is 25.

8. **Fill CAN Frames** returns whether a CAN frame is transmitted with 
8 bytes or less.

   0: Short CAN frames are sent with \(\text{DLC} < 8\).
   1: Short CAN frames are filled to 8 bytes with **Fill Byte** (default).

9. **Fill Byte** returns the CAN frame content if filled with defined data or 
random data bytes.

   0–255: Byte is used optionally to fill short CAN frames.
   256: Short CAN frames are filled optionally with random bytes.

   The default is 255 (0xFF).

10. **Invalid Response as Error** returns how the toolkit handles an 
invalid ECU response.

    0: Invalid response is indicated by \texttt{success? = FALSE} only (default).
    1: Invalid response is returned as an error in addition.

11. **Max RspPending Count** is the number of times a 
    \texttt{ReqCorrectlyRcvd-RspPending (0x78) Negative Response Message} 
    will be accepted to extend the command timeout (default 5). If this 
    message is sent more often in response to a request, an error \(-8120\) is 
    returned. If the ECU implements commands with a long duration 
    (for example, flash commands), you may need to extend this number.

12. **VWTP Command Time Out** is the time in milliseconds the host 
    waits for a VWTP 2.0 command to be executed (default 50 ms). The 
    specification states this as 50 ms plus the network latency, but some 
    ECUs may require higher values.

**error in** is a cluster that describes error conditions occurring before the VI 
executes. It is copied unchanged to **error out** and has no other effect on the 
VI. It is provided for sequencing purposes only.
Output

- **property value** is the requested property value.
- **error out** describes error conditions. It is copied unchanged from the **error in** cluster. It is provided for sequencing purposes only.

Description

Use this VI to request several internal diagnostic parameters, such as timeouts for the transport protocol. Use **Diag Set Property.vi** to modify them.
Diag Set Property.vi

Purpose
Sets a diagnostic global internal parameter.

Format

```
property ID defines the parameter whose value is to be retrieved. You can create the values using an Enum control.

0 Timeout Diag Command is the timeout in milliseconds the master waits for the response to a diagnostic request message. The default is 1000 ms.

1 Timeout FC (Bs) is the timeout in milliseconds the master waits for a Flow Control frame after sending a First Frame or the last Consecutive Frame of a block. The default is 250 ms.

2 Timeout CF (Cr) is the timeout in milliseconds the master waits for a Consecutive Frame in a multiframe response. The default is 250 ms.

3 Receive Block Size (BS) is the number of Consecutive Frames the slave sends in one block before waiting for the next Flow Control frame. A value of 0 (default) means all Consecutive Frames are sent in one run without interruption.

4 Wait Time CF (STmin) defines the minimum time for the slave to wait between sending two Consecutive Frames of a block. Values from 0 to 127 are wait times in milliseconds. Values 241 to 249 (Hex F1 to F9) mean wait times of 100 µs to 900 µs, respectively. All other values are reserved. The default is 5 ms.

5 Max Wait Frames (N_WFTmax) is the maximum number of WAIT frames the master accepts before terminating the connection. The default is 10.
```
6 Wait Frames to Send (N_WAIT) is the number of WAIT frames the master sends every time before a CTS frame is sent. If this value is set to a negative number (for example, 0xFFFFFFFF = −1), the master sends an OVERLOAD frame instead of a WAIT, and reception is aborted. The default is 0 for maximum speed.

7 Time between Waits (T_W) is the number of milliseconds the master waits after sending a WAIT frame. The default is 25.

8 Fill CAN Frames specifies whether a CAN frame is transmitted with 8 bytes or less.

0: Short CAN frames are sent with DLC < 8.

1: Short CAN frames are filled to 8 bytes with Fill Byte (default).

9 Fill Byte specifies the CAN frame content, filled with defined data or random data.

0–255: Byte is used optionally to fill short CAN frames.

256: Short CAN frames are filled optionally with random bytes.

The default is 255 (0xFF).

10 Invalid Response as Error specifies how the toolkit handles an invalid ECU response.

0: Invalid response is indicated by success? = FALSE only (default).

1: Invalid response is returned as an error in addition.

11 Max RspPending Count defines the number of times a ReqCorrectlyRcvd-RspPending (0x78) Negative Response Message will be accepted to extend the command timeout (default 5). If this message is sent more often in response to a request, an error −8120 is returned. If the ECU implements commands with a long duration (for example, flash commands), you may need to extend this number.

12 VWTP Command Time Out sets the time in milliseconds the host waits for a VWTP 2.0 command to be executed (default 50 ms). The specification states this as 50 ms plus the network latency, but some ECUs may require higher values.

property value is the value of the property to be set.

ero error in is a cluster that describes error conditions occurring before the VI executes. It is copied unchanged to error out and has no other effect on the VI. It is provided for sequencing purposes only.
Output

error out describes error conditions. It is copied unchanged from the error in cluster. It is provided for sequencing purposes only.

Description

Use this VI to set several internal diagnostic parameters such as timeouts for the transport protocol. Use Diag Get Property.vi to read them out.
Diagnostic Frame Recv.vi

Purpose
Receives a raw CAN frame on the diagnostic CAN ID to check for errors in the transport protocol implementation of an ECU.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>specifies the time in milliseconds to wait for a frame on the diagnostic identifier. If no frame arrives within this time, a timeout error is returned.</td>
</tr>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>
</tr>
<tr>
<td>error in</td>
<td>is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.</td>
</tr>
</tbody>

</tr>
<tr>
<td>source</td>
<td>identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
**Output**

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**data out** returns up to 8 bytes of payload data from a CAN frame received on the diagnostic identifier.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Description**

**Diagnostic Frame Recv.vi** receives an arbitrary raw CAN frame on the diagnostic CAN identifier. For example, you can check the transport protocol implementation of an ECU for correct responses if erroneous protocol requests are issued.
Diagnostic Frame Send.vi

Purpose
Sends a raw CAN frame on the diagnostic CAN ID to check for errors in the transport protocol implementation of an ECU.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>
</tr>
<tr>
<td>data in</td>
<td>is an array of up to 8 bytes sent as a CAN payload on the diagnostic identifier.</td>
</tr>
<tr>
<td>error in</td>
<td>is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.</td>
</tr>

source | identifies the VI where the error occurred. |
Output

- **diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.
  - **status** is TRUE if an error occurred.
  - **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
  - **source** identifies the VI where the error occurred.

Description

**Diagnostic Frame Send.vi** transmits an arbitrary raw CAN frame on the diagnostic CAN identifier. For example, you can check the transport protocol implementation of an ECU for robustness if erroneous protocol requests are issued.
Diagnostic Service.vi

Purpose
Executes a generic diagnostic service. If a special service is not available through the KWP2000, UDS, or OBD service functions, you can build it using this VI.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>
</tr>
<tr>
<td>require response?</td>
<td>indicates whether a diagnostic service expects a response (TRUE) or not (FALSE). In the latter case, error code is returned as 0, and data out as an empty array.</td>
</tr>
<tr>
<td>data in</td>
<td>defines the diagnostic service request message sent to the ECU as a stream of bytes.</td>
</tr>
<tr>
<td>error in</td>
<td>is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.</td>
</tr>

</tr>
<tr>
<td>code</td>
<td>is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.</td>
</tr>
<tr>
<td>source</td>
<td>identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
**Output**

*diag ref out* is a copy of *diag ref in*. You can wire it to subsequent diagnostic VIs.

*error code* is the error code sent with a negative response message. In addition, the error cluster indicates an error and gives a more detailed description. If no negative response message occurred, 0 is returned.

*data out* returns the diagnostic service response message (positive or negative) the ECU sends as a stream of bytes.

*error out* describes error conditions. If the *error in* cluster indicated an error, the *error out* cluster contains the same information. Otherwise, *error out* describes the error status of this VI.

*status* is TRUE if an error occurred.

*code* is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the *code*, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

*source* identifies the VI where the error occurred.

**Description**

*Diagnostic Service.vi* is a generic routine to execute any diagnostic service. The request and response messages are fed unmodified to the *data in* input and retrieved from the *data out* output, respectively. No interpretation of the contents is done, with one exception: the error number is retrieved from a negative response, if one occurs. In this case, an error also is communicated through the *error out* cluster.

All specialized diagnostic services call *Diagnostic Service.vi* internally.
DTC to String.vi

Purpose
Returns a string representation (such as P1234) for a 2-byte Diagnostic Trouble Code (DTC).

Format

<table>
<thead>
<tr>
<th>DTC (num) → DTC (string)</th>
</tr>
</thead>
</table>

Input

- **DTC (num)** is the DTC number as returned in the clusters of
  - ReadDTCByStatus.vi, ReadStatusOfDTC.vi,
  - UDS ReportDTCBySeverityMaskRecord.vi,
  - UDS ReportDTCByStatusMask.vi,
  - UDS ReportSeverityInformationOfDTC.vi,
  - UDS ReportSupportedDTCs.vi, OBD Request Emission Related DTCs.vi, or OBD Request Emission Related DTCs During Current Drive Cycle.vi.

Note
This VI converts only 2-byte DTCs. If you feed in larger numbers, the VI returns garbage.

Output

- **DTC (string)** is the DTC string representation.

Description
The SAE J2012 standard specifies a naming scheme for 2-byte DTCs consisting of one letter and four digits. Use **DTC to String.vi** to convert a DTC numerical representation to this name.
OBD Open.vi

Purpose
Opens an OBD-II diagnostic session on a CAN port.

Format

<table>
<thead>
<tr>
<th>CAN interface</th>
<th>baudrate</th>
<th>diag ref out</th>
</tr>
</thead>
<tbody>
<tr>
<td>error in (no error)</td>
<td>error out</td>
<td></td>
</tr>
</tbody>
</table>

Input

CAN interface specifies the CAN interface on which the diagnostic communication should take place.

NI-CAN

The CAN interface is the name of the NI-CAN Network Interface Object to configure. This name uses the syntax CANx, where x is a decimal number starting at 0 that indicates the CAN network interface (CAN0, CAN1, up to CAN63). CAN network interface names are associated with physical CAN ports using Measurement and Automation Explorer (MAX).

NI-XNET

By default, the Automotive Diagnostic Command Set uses NI-CAN for CAN communication. This means you must define an NI-CAN interface for your NI-XNET hardware (NI-CAN compatibility mode) to use your XNET hardware for CAN communication. However, to use your NI-XNET interface in the native NI-XNET mode (meaning it does not use the NI-XNET Compatibility Layer), you must define your interface under **NI-XNET Devices** in MAX and pass the NI-XNET interface name that the Automotive Diagnostic Command Set will use. To do this, add @ni_genie_nixnet to the protocol string (for example, CAN1@ni_genie_nixnet). The interface name is related to the NI-XNET hardware naming under **Devices and Interfaces** in MAX.

CompactRIO or R Series

If using CompactRIO or R Series hardware, you must provide a bitfile that handles the CAN communication between the host system and FPGA. To access the CAN module on the FPGA, you must specify the bitfile name after the @ (for example, CAN1@MyBitfile.lvbitx). To specify a special
RIO target, you can specify that target by its name followed by the bitfile name (for example, CAN1@RIO1, MyBitfile.lvbitx). Currently, only a single CAN interface is supported. RIO1 defines the RIO target name as defined in your LabVIEW Project definition. The lvbitx filename represents the filename and location of the bitfile on the host if using RIO or on a CompactRIO target. This implies that you must download the bitfile to the CompactRIO target before you can run your application. You may specify an absolute path or a path relative to the root of your target for the bitfile.

**baudrate** is the diagnostic communication baud rate.

**error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
- **source** identifies the VI where the error occurred.

**Output**

**diag ref out** is a cluster containing all necessary diagnostic session information. Wire this cluster as a handle to all subsequent diagnostic VIs and close it using Close Diagnostic.vi.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
- **source** identifies the VI where the error occurred.
Description

Use this VI to open a diagnostic communication channel to an ECU for OBD-II. The CAN port specified as input is initialized, and a handle to it is stored (among other internal data) in the `diag ref out` cluster, which serves as reference for further diagnostic functions.

Possible examples of selections for the interface parameter for the various hardware targets are as follows.

Using NI-CAN hardware:
- `CAN0`—uses CAN interface 0.
- `CAN1`—uses CAN interface 1 and so on with the form `CANx`.
- `CAN256`—uses virtual NI-CAN interface 256.

Using NI-XNET hardware:
- `CAN1@ni_genie_nixnet`—uses CAN interface 1 of an NI-XNET device.
- `CAN2@ni_genie_nixnet`—uses CAN interface 2 of an NI-XNET device and so on with the form `CANx`.

Using R Series:
- `CAN1@RIO1,c:\temp\MyFpgaBitfile.lvbitx`—uses a named target RIO1 as compiled into the bitfile at location `c:\temp\MyFpgaBitfile.lvbitx`.

Using CompactRIO
- `CAN1@MyFpgaBitfile.lvbitx`—uses compiled bitfile `MyFpgaBitfile.lvbitx`, which must be FTP copied to the root of the CompactRIO target.

First, communication to the ECU is tried on the default 11-bit OBD CAN identifiers; if that fails, the default 29-bit OBD CAN identifiers are tried. If that also fails, the VI returns an error.

You can overwrite the default OBD CAN identifiers optionally with any other identifiers.

In general, it is not necessary to manipulate the `diag ref out` cluster contents.
Open Diagnostic.vi

Purpose
Opens a diagnostic session on a CAN port. Communication to the ECU is not yet started.

Format

```
CAN interface
baudrate
transport protocol
event in (no error)
transmit ID
receive ID
diag ref out
diag out
error out
```

Input

- **CAN interface** specifies the CAN interface on which the diagnostic communication should take place. The values are CAN0, CAN1, and so on.

**NI-CAN**
The CAN interface is the name of the NI-CAN Network Interface Object to configure. This name uses the syntax `CANx`, where `x` is a decimal number starting at 0 that indicates the CAN network interface (CAN0, CAN1, up to CAN63). CAN network interface names are associated with physical CAN ports using Measurement and Automation Explorer (MAX).

**NI-XNET**
By default, the Automotive Diagnostic Command Set uses NI-CAN for CAN communication. This means you must define an NI-CAN interface for your NI-XNET hardware (NI-CAN compatibility mode) to use your XNET hardware for CAN communication. However, to use your NI-XNET interface in the native NI-XNET mode (meaning it does not use the NI-XNET Compatibility Layer), you must define your interface under **NI-XNET Devices** in MAX and pass the NI-XNET interface name that the Automotive Diagnostic Command Set will use. To do this, add `@ni_genie_nixnet` to the protocol string (for example, `CAN1@ni_genie_nixnet`). The interface name is related to the NI-XNET hardware naming under **Devices and Interfaces** in MAX.

**CompactRIO or R Series**
If using CompactRIO or R Series hardware, you must provide a bitfile that handles the CAN communication between the host system and FPGA. To access the CAN module on the FPGA, you must specify the bitfile name
after the @ (for example, CAN1@MyBitfile.lvbitx). To specify a special RIO target, you can specify that target by its name followed by the bitfile name (for example, CAN1@RIO1, MyBitfile.lvbitx). Currently, only a single CAN interface is supported. RIO1 defines the RIO target name as defined in your LabVIEW Project definition. The lvbitx filename represents the filename and location of the bitfile on the host if using RIO or on a CompactRIO target. This implies that you must download the bitfile to the CompactRIO target before you can run your application. You may specify an absolute path or a path relative to the root of your target for the bitfile.

baudrate is the diagnostic communication baud rate.

transport protocol specifies the transport protocol for transferring the diagnostic service messages over the CAN network. The following values are valid and can be obtained through an enum control:

0 ISO TP—Normal Mode: The ISO TP as specified in ISO 15765-2 is used; all eight data bytes of the CAN messages are used for data transfer.

1 ISO TP—Mixed Mode: The ISO TP as specified in ISO 15765-2 is used; the first data byte is used as address extension.

2 VW TP 2.0

transmit ID is the CAN identifier for sending diagnostic request messages from the host to the ECU. To specify an extended (29-bit) ID, OR the value with 0x20000000.

receive ID is the CAN identifier or sending diagnostic response messages from the ECU to the host. To specify an extended (29-bit) ID, OR the value with 0x20000000.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
source identifies the VI where the error occurred.

**Output**

diag ref out is a cluster containing all necessary diagnostic session information. Wire this cluster as a handle to all subsequent diagnostic VIs and close it using Close Diagnostic.vi.

test out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

**Description**

Open Diagnostic.vi opens a diagnostic communication channel to an ECU. The CAN port specified as input is initialized, and a handle to it is stored (among other internal data) in the diag ref out cluster, which serves as reference for further diagnostic functions.

Possible examples of selections for the interface parameter for the various hardware targets are as follows.

Using NI-CAN hardware:

- **CAN0**—uses CAN interface 0.
- **CAN1**—uses CAN interface 1 and so on with the form CANx.
- **CAN256**—uses virtual NI-CAN interface 256.
- **CAN257**—uses virtual NI-CAN interface 257.

Using NI-XNET hardware:

- **CAN1@ni_genie_nixnet**—uses CAN interface 1 of an NI-XNET device.
- **CAN2@ni_genie_nixnet**—uses CAN interface 2 of an NI-XNET device and so on with the form CANx.
Using R Series:

- CAN1@RIO1,c:\temp\MyFpgaBitfile.lvbitx—uses a named target RIO1 as compiled into the bitfile at c:\temp\MyFpgaBitfile.lvbitx.

Using CompactRIO

- CAN1 \MyFpgaBitfile.lvbitx—uses compiled bitfile MyFpgaBitfile.lvbitx, which must be FTP copied to the root of the CompactRIO target.

Note No communication to the ECU takes place at this point. To open a diagnostic session on the ECU, call StartDiagnosticSession.vi or UDS DiagnosticSessionControl.vi.

In general, it is not necessary to manipulate the diag ref out cluster contents, with one notable exception: If you use the ISO TP—Mixed Mode transport protocol, you must store the address extensions for transmit and receive in the appropriate cluster members.
Open Diagnostic on IP.vi

Purpose

Opens a diagnostic session on an IP port. Communication to the ECU is not yet started.

Format

Input

dynamic port? defines whether the standard UDP port 13401 (UDP_TEST_EQUIPMENT_LISTEN) is used for communication (FALSE) or a dynamically assigned UDP port (UDP_TEST_EQUIPMENT_REQUEST) is opened (TRUE). Default is TRUE.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
Output

**Diag reference out** is a cluster containing all necessary information about the diagnostic session. Wire this output as a handle to all subsequent diagnostic VIs, and close it using **Close Diagnostic.vi**.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

Description

**Open Diagnostic on IP.vi** opens a Diagnostic on Internet Protocol (DoIP) communication channel to an ECU. The UDP port specified as input is initialized, and a handle to it is stored (among other internal data) in the **Diag reference out** cluster, which serves as reference for further diagnostic functions.

Note that no communication to an ECU takes place at this point. To open a diagnostic session on an ECU, call **DoIP Get Entities.vi** to find out which DoIP entities (DoIP-capable ECUs) exist in the network. You need to create a TCP/IP connection to the selected DoIP entity using **DoIP Connect.vi**. After that, you can execute diagnostic services on the TCP/IP connection.

This VI replaces the standard (CAN-based) **Open Diagnostic.vi**, because the CAN parameters are no longer relevant for IP-based diagnostics.

In general, you do not need to manipulate the **Diag reference out** cluster contents.
VWTP Connect.vi

Purpose
Establishes a connection channel to an ECU using the VW TP 2.0.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>diag ref out</td>

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

For the VW TP 2.0, you must establish a connection to the ECU before any diagnostic communication can occur. This VI sets up a unique communication channel to an ECU for subsequent diagnostic service requests.

Note You must maintain the communication link you created by periodically (at least once a second) calling VWTP Connection Test.vi.

There is no equivalent for the ISO TP (ISO 15765-2), as the ISO TP does not use a special communication link.
Chapter 5  Automotive Diagnostic Command Set API for LabVIEW

VWTP Connection Test.vi

Purpose
Maintains a connection channel to an ECU using the VW TP 2.0.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>diag ref out</td>
</tr>
<tr>
<td>error in</td>
<td>error out</td>
</tr>
</tbody>
</table>
```

Input
- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.
- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
- **source** identifies the VI where the error occurred.
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

For the VW TP 2.0, you must periodically maintain the connection link to the ECU so that the ECU does not terminate it.

This VI sends a Connection Test message to the ECU and evaluates its response, performing the steps necessary to maintain the connection.

There is no equivalent for the ISO TP (ISO 15765-2), as the ISO TP does not use a special communication link.
VWTP Disconnect.vi

**Purpose**
Terminates a connection channel to an ECU using the VW TP 2.0.

**Format**

<table>

error in           |
```
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

For the VW TP 2.0, you must disconnect the connection link to the ECU to properly terminate communication to the ECU. This VI sends the proper disconnect messages and unlinks the communication.

You can create a new connection to the same ECU using VWTP Connect.vi again.

There is no equivalent for the ISO TP (ISO 15765-2), as the ISO TP does not use a special communication link.
DoIP Functions

DoIP Activate Routing.vi

Purpose
Defines the source and target addresses for a DoIP TCP/IP connection.

the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

### Output

- **Diag reference out** is a copy of **Diag reference in**. You can wire it to subsequent diagnostic VIs.

- **Target Address** is the logical address of the responding DoIP entity.

- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

- source identifies the VI where the error occurred.

### Description

**DoIP Activate Routing.vi** establishes a route for the DoIP messages and assigns an endpoint **Target Address**. After successfully establishing a route, diagnostic messages can be exchanged with the target DoIP entity using any diagnostic service VI.
DoIP Connect.vi

Purpose

Creates a TCP/IP connection to a DoIP entity identified by its IP address.

Format

![Diagram of DoIP Connect.vi]

Input

- **Diag reference in** specifies the diagnostic session handle, obtained from Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

- **address** is the IP address of the DoIP entity to connect to (a string in a.b.c.d notation).

- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

  - **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

  - **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

  - **source** identifies the VI where the error occurred.

- **Source Address** is the DoIP source address of the tester that starts the communication. You can leave this input unwired if you are activating a route through DoIP Activate Routing.vi.
Target Address is the DoIP target address of the device under test that should be connected to. You can leave this input unwired if you are activating a route through DoIP Activate Routing.vi.

Output

Diag reference out is a copy of Diag reference in. You can wire it to subsequent diagnostic VIs.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

DoIP Connect.vi creates a unique TCP/IP data connection to a certain DoIP entity identified by its IP address. The IP address might be retrieved from DoIP Get Entities.vi. The TCP/IP data connection is needed to exchange diagnostic service requests.

You can specify Source Address and Target Address at this point or leave them blank if a routing activation is executed later using DoIP Activate Routing.vi.
**DoIP Disconnect.vi**

**Purpose**
Disconnects the TCP/IP connection to a DoIP entity.

**Format**

```
Input

- **Diag reference in** specifies the diagnostic session handle, obtained from Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

- **source** identifies the VI where the error occurred.
```
Output

**Diag reference out** is a copy of **Diag reference in**. You can wire it to subsequent diagnostic VIs.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

Description

**DoIP Disconnect.vi** terminates the TCP/IP connection to the connected DoIP entity. After executing this VI, diagnostic services no longer can be executed on that DoIP entity. You can reconnect with **DoIP Connect.vi**.
DoIP Get Diagnostic Power Mode.vi

Purpose
Gets information about the DoIP entity power state.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>

Output

**Diag reference out** is a copy of **Diag reference in**. You can wire it to subsequent diagnostic VIs.

**power mode** identifies whether the vehicle is in Diagnostic Power Mode and ready to perform reliable diagnostics. Possible values are:

- 0 Not ready
- 1 Ready

All other values are reserved.

**ok?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

Description

**DoIP Get Diagnostic Power Mode.vi** retrieves the Diagnostic Power Mode of a vehicle. For example, test equipment can use this information to verify whether the vehicle is in Diagnostic Power Mode, which allows for performing reliable diagnostics on the vehicle’s components.
DoIP Get DoIP Entity Status.vi

Purpose

Gets status information from a DoIP entity.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Diag reference in</strong></td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>

- **source** identifies the VI where the error occurred.
Output

**Diag reference out** is a copy of **Diag reference in**. You can wire it to subsequent diagnostic VIs.

**node type** is a U8 ring that indicates the type of DoIP entity. Possible values are:

- 0  DoIP gateway
- 1  DoIP node

All other values are reserved.

**ok?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

**max sockets** represents the maximum number of concurrent TCP/IP sockets allowed with this DoIP entity excluding the reserve socket required for socket handling.

**cur sockets** is the number of currently established TCP/IP sockets.

Description

**DoIP Get DoIP Entity Status.vi** identifies certain operating conditions of the responding DoIP entity. For example, this allows for test equipment to detect existing diagnostic communication sessions as well as the capabilities of a DoIP entity.
DoIP Get Entities.vi

Purpose
Returns a table of all DoIP entities (vehicles) on the local subnet, possibly restricted to EID or VIN.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Diag reference in</strong> specifies the diagnostic session handle, obtained from <strong>Open Diagnostic on IP.vi</strong> and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>

```
execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output

Diag reference out is a copy of Diag reference in. You can wire it to subsequent diagnostic VIs.

DoIP Entities is an array of clusters, each of which contains the description of one DoIP entity that responded to the command:

VIN is the 17-character Vehicle Identification Number of the DoIP entity. It can be blank if the DoIP entity does not yet belong to a vehicle.

Source Address is the 16-bit DoIP address of this entity. This address can distinguish multiple DoIP entities within a vehicle.

EID is a 6-byte array of the Entity ID, which is usually the DoIP device MAC address.

GID is a unique 6-byte group identification of DoIP entities that belong to the same vehicle. It is used as long as a VIN is not yet defined.

IP Address is the IP Address of this DoIP entity in a.b.c.d notation. Use this IP address to connect to the DoIP entity using DoIP Connect.vi.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
Description

DoIP Get Entities.vi uses a UDP broadcast to identify all DoIP entities in the local subnet matching a certain condition. The entities responding are returned in the DoIP Entities cluster array.

The conditions are either a common VIN or EID or simply all entities connected. Refer to the DoIP Open Type and VIN or EID descriptions.
DoIP Send Vehicle Identification Request.vi

Purpose
Sends a UDP request to all DoIP-capable vehicles in the local subnet to identify themselves.

Format

<table>
<thead>
<tr>
<th>Input</th>

source identifies the VI where the error occurred.

Description

DoIP Send Vehicle Identification Request.vi sends a Vehicle Identification Request to all DoIP entities in the local subnet.

Usually, this is done as part of DoIP Get Entities.vi and does not need to be executed separately.
DoIP Send Vehicle Identification Request w EID.vi

Purpose

Sends a UDP request to all DoIP-capable vehicles with a certain EID (MAC address) in the local subnet to identify themselves.

Format

<table>
<thead>
<tr>

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

Description

**DoIP Send Vehicle Identification Request w EID.vi** sends a Vehicle Identification Request to all DoIP entities in the local subnet identified by the given **EID**.

Usually, this is done as part of **DoIP Get Entities.vi** and does not need to be executed separately.
DoIP Send Vehicle Identification Request w VIN.vi

Purpose

Sends a UDP request to all DoIP-capable vehicles with a certain VIN (Vehicle Identification Number) in the local subnet to identify themselves.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diag reference in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>

</tr>
<tr>
<td>error in</td>
<td>is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.</td>
</tr>
</tbody>
</table>

Input

- **Diag reference in** specifies the diagnostic session handle, obtained from Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
- **VIN** is the 17-character Vehicle Identification Number of the DoIP entity assumed to respond.
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
- **source** identifies the VI where the error occurred.
Chapter 5 Automotive Diagnostic Command Set API for LabVIEW

Output

Diag reference out is a copy of Diag reference in. You can wire it to subsequent diagnostic VIs.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

DoIP Send Vehicle Identification Request w VIN.vi sends a Vehicle Identification Request to all DoIP entities in the local subnet identified by the given VIN.

Usually, this is done as part of DoIP Get Entities.vi and does not need to be executed separately.
KWP2000 Services

ClearDiagnosticInformation.vi

Purpose

Executes the ClearDiagnosticInformation service and clears selected Diagnostic Trouble Codes (DTCs).

Format

**Input**

- **DTC descriptor** is a cluster that describes the DTC records the ECU delivers:
  - **DTC Byte Length** indicates the number of bytes the ECU sends for each DTC. The default is 2.
  - **Status Byte Length** indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.
  - **Add Data Byte Length** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there is no additional data, so the default is 0.
  - **Byte Order** indicates the byte ordering for multibyte items:
    - 0: MSB_FIRST (Motorola) (default)
    - 1: LSB_FIRST (Intel)

The **DTC descriptor** is given here as a parameter basically to convert the **group of DTC** parameter to a binary representation according to **DTC Byte Length** and **Byte Order**.

- **diag ref in** specifies the diagnostic session handle, obtained from **Open Diagnostic.vi** or **Open Diagnostic on IP.vi** and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
group of DTC specifies the group of Diagnostic Trouble Codes to be cleared. The following values have a special meaning, and you can specify them through a ring control:

- 0x0000  All powertrain DTCs
- 0x4000  All chassis DTCs
- 0x8000  All body DTCs
- 0xC000  All network-related DTCs
- 0xFF00  All DTCs

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

- status is TRUE if an error occurred. This VI is not executed when status is TRUE.
- code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
- source identifies the VI where the error occurred.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

- success? indicates successful receipt of a positive response message for this diagnostic service.
- error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.
- status is TRUE if an error occurred.
**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Description**

This VI clears the diagnostic information on the ECU memory. If the **group of DTC** parameter is present, the ECU is requested to clear all memory including the DTCs.

For further details about this service, refer to the ISO 14230-3 standard.
ControlDTCSetting.vi

**Purpose**
Executes the ControlDTCSetting service and modifies the generation behavior of selected Diagnostic Trouble Codes (DTCs).

**Format**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DTC descriptor</td>
<td>is a cluster that describes the DTC records the ECU delivers:</td>

</tbody>
</table>

The **DTC descriptor** is given here as a parameter basically to convert the **group of DTC** parameter to a binary representation according to **DTC Byte Length** and **Byte Order**.

**diag ref in** specifies the diagnostic session handle, obtained from **Open Diagnostic.vi** or **Open Diagnostic on IP.vi** and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

**data in** specifies application-specific data that control DTC generation.
group of DTC specifies the group of Diagnostic Trouble Codes to be controlled. The following values have a special meaning, and you can specify them through a ring control:

- 0x0000 All powertrain DTCs
- 0x4000 All chassis DTCs
- 0x8000 All body DTCs
- 0xC000 All network-related DTCs
- 0xFF00 All DTCs

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.
code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
DisableNormalMessageTransmission.vi

Purpose
Executes the DisableNormalMessageTransmission service. The ECU no longer transmits its regular communication messages (usually CAN messages).

Format

```
Input

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>

```
Output

- **diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

- **success?** indicates successful receipt of a positive response message for this diagnostic service.

- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is **TRUE** if an error occurred.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

- **source** identifies the VI where the error occurred.
ECUReset.vi

Purpose
Executes the ECUReset service. Resets the ECU.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
</tr>
<tr>
<td>error in (no error)</td>
</tr>
<tr>
<td>diag ref out</td>
</tr>
</tbody>
</table>
```

Input

*diag ref in* specifies the diagnostic session handle, obtained from *Open Diagnostic.vi* or *Open Diagnostic on IP.vi* and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

*mode* indicates the reset mode:

<table>
<thead>
<tr>
<th>Hex</th>

</tbody>
</table>
error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI requests the ECU to perform an ECU reset effectively based on the mode parameter value content. The vehicle manufacturer determines when the positive response message is sent.
EnableNormalMessageTransmission.vi

Purpose
Executes the EnableNormalMessageTransmission service. The ECU starts transmitting its regular communication messages (usually CAN messages).

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>

</tr>
<tr>
<td>source</td>
<td>identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
Output

- **diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

- **success?** indicates successful receipt of a positive response message for this diagnostic service.

- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

  - **status** is TRUE if an error occurred.

  - **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

  - **source** identifies the VI where the error occurred.
InputOutputControlByLocalIdentifier.vi

Purpose
Executes the InputOutputControlByLocalIdentifier service. Modifies ECU I/O port behavior.

Format

Input

- **data in** defines application-specific data for this service.
- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
- **local ID** defines the local identifier of the I/O to be manipulated. The values are application specific.
- **mode** defines the type of I/O control. The values are application specific. The usual values are:
  - 0: ReturnControlToECU
  - 1: ReportCurrentState
  - 4: ResetToDefault
  - 5: FreezeCurrentState
  - 7: ShortTermAdjustment
  - 8: LongTermAdjustment
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output
diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.
data out returns application-specific data for this service.
success? indicates successful receipt of a positive response message for this diagnostic service.
error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.
status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description
This VI substitutes a value for an input signal or internal ECU function. It also controls an output (actuator) of an electronic system referenced by the local ID parameter.

For further details about this service, refer to the ISO 14230-3 standard.
ReadDataByLocalIdentifier.vi

Purpose
Executes the ReadDataByLocalIdentifier service. Reads a data record from the ECU.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
</tr>
<tr>
<td>local ID</td>
</tr>
<tr>
<td>error in (no error)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref out</td>
</tr>
<tr>
<td>data out</td>
</tr>
<tr>
<td>success?</td>
</tr>
<tr>
<td>error out</td>
</tr>
</tbody>
</table>
```

Input

- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

- **local ID** defines the local identifier of the data to be read. The values are application specific.

- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

Output

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

- **source** identifies the VI where the error occurred.
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

data out returns the data record from the ECU. If you know the record data description, you can interpret this record using Convert from Phys.vi.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI requests data record values from the ECU identified by the local ID parameter.

For further details about this service, refer to the ISO 14230-3 standard.
ReadDTCByStatus.vi

Purpose
Executes the ReadDiagnosticTroubleCodesByStatus service. Reads selected Diagnostic Trouble Codes (DTCs).

Format

<table>
<thead>
<tr>
<th>DTC descriptor</th>
<th>diag ref in</th>
<th>mode</th>
<th>group of DTC</th>
<th>error in (no error)</th>
<th>diag ref out</th>
<th>DTCs</th>
<th>success?</th>
<th>error out</th>
</tr>
</thead>
</table>

Input

DTC descriptor is a cluster that describes the DTC records the ECU delivers:

- **DTC Byte Length** indicates the number of bytes the ECU sends for each DTC. The default is 2.
- **Status Byte Length** indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.
- **Add Data Byte Length** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there is no additional data, so the default is 0.
- **Byte Order** indicates the byte ordering for multibyte items:
  - 0: MSB_FIRST (Motorola) (default)
  - 1: LSB_FIRST (Intel)

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs cluster array.

diag ref in specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
**mode** defines the type of DTCs to be read. The values are application specific. The usual values are:

2: AllIdentified
3: AllSupported

**group of DTC** specifies the group of Diagnostic Trouble Codes to be read. The following values have a special meaning, and you can specify them through a ring control:

0x0000  All powertrain DTCs
0x4000  All chassis DTCs
0x8000  All body DTCs
0xC000  All network-related DTCs
0xFF00  All DTCs

**error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

**status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Output**

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**DTCs** returns the resulting DTCs as an array of clusters:

**DTC** is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, you can use **DTC to String.vi** to convert this to readable format as defined by SAE J2012.
**Status** is the DTC status. Usually, this is a bit field with the following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

**Add Data** contains optional additional data for this DTC. Usually, this does not contain valid information (refer to [DTC descriptor](#)).

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Description**

This VI reads DTCs by status from the ECU memory. If you use the optional **group of DTC** parameter, the ECU reports DTCs only with status information based on the functional group selected by **group of DTC**.

For further details about this service, refer to the ISO 14230-3 standard.
ReadECUIdentification.vi

Purpose
Executes the ReadECUIdentification service. Returns ECU identification data.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>

</tbody>
</table>

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**data out** returns the ECU identification data.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

*status* is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

Description

This VI requests identification data from the ECU. The **mode** parameter identifies the type of identification data requested. The ECU returns identification data that the **data out** parameter can access. The **data out** format and definition are vehicle manufacturer specific.

For further details about this service, refer to the ISO 14230-3 standard.
ReadMemoryByAddress.vi

Purpose
Executes the ReadMemoryByAddress service. Reads data from the ECU memory.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>diag ref in</strong></td>

</tr>
<tr>
<td><strong>source</strong></td>
<td>identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

Data out returns the memory data from the ECU.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI requests memory data from the ECU identified by the address and size parameters. The data out format and definition are vehicle manufacturer specific. data out includes analog input and output signals, digital input and output signals, internal data, and system status information if the ECU supports them.

For further details about this service, refer to the ISO 14230-3 standard.
ReadStatusOfDTC.vi

Purpose
Executes the ReadStatusOfDiagnosticTroubleCodes service. Reads selected Diagnostic Trouble Codes (DTCs).

Format

```
DTC descriptor
   diag ref in
   DTCs
   diag ref out
   status
   error in (no error)
   error out
```

Input

DTC descriptor is a cluster that describes the DTC records the ECU delivers:

- **DTC Byte Length** indicates the number of bytes the ECU sends for each DTC. The default is 2.
- **Status Byte Length** indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.
- **Add Data Byte Length** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there is no additional data, so the default is 0.
- **Byte Order** indicates the byte ordering for multibyte items:
  - 0: MSB_FIRST (Motorola) (default)
  - 1: LSB_FIRST (Intel)

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs cluster array.

**diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
**group of DTC** specifies the group of Diagnostic Trouble Codes to be read. The following values have a special meaning, and you can specify them through a ring control:

- 0x0000  All powertrain DTCs
- 0x4000  All chassis DTCs
- 0x8000  All body DTCs
- 0xC000  All network-related DTCs
- 0xFF00  All DTCs

**error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

**Output**

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**DTCs** returns the resulting DTCs as an array of clusters:

- **DTC** is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, you can use **DTC to String.vi** to convert this to readable format as defined by SAE J2012.
- **Status** is the DTC status. Usually, this is a bit field with the following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
</tbody>
</table>
2 pendingDTC
3 confirmedDTC
4 testNotCompletedSinceLastClear
5 testFailedSinceLastClear
6 testNotCompletedThisMonitoringCycle
7 warningIndicatorRequested

**Add Data** contains optional additional data for this DTC. Usually, this does not contain valid information (refer to **DTC descriptor**).

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Description**

This VI reads diagnostic trouble codes from the ECU memory. If you use the optional **group of DTC** parameter, the ECU reports DTCs based only on the functional group selected by **group of DTC**.

For further details about this service, refer to the ISO 14230-3 standard.
RequestRoutineResultsByLocalIdentifier.vi

Purpose
Executes the RequestRoutineResultsByLocalIdentifier service. Returns results from a routine on the ECU.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>diag ref in</strong></td>
</tr>
<tr>
<td><strong>local ID</strong></td>
</tr>
<tr>
<td><strong>error in (no error)</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>diag ref out</strong></td>
</tr>
<tr>
<td><strong>data out</strong></td>
</tr>
<tr>
<td><strong>success?</strong></td>
</tr>
<tr>
<td><strong>error out</strong></td>
</tr>
</tbody>
</table>
```

Input
diag ref in specifies the diagnostic session handle, obtained from *Open Diagnostic.vi* or *Open Diagnostic on IP.vi* and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

local ID defines the local identifier of the routine from which this VI retrieves results. The values are application specific.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the *Simple Error Handler*.

source identifies the VI where the error occurred.
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

data out returns application-specific output parameters from the routine.
success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI requests results (for example, exit status information) referenced by local ID and generated by the routine executed in the ECU memory.

For further details about this service, refer to the ISO 14230-3 standard.
RequestSeed.vi

Purpose
Executes the SecurityAccess service to retrieve a seed from the ECU.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>
</tr>
<tr>
<td>access mode</td>
<td>indicates the security level to be granted. The values are application specific. This is an odd number, usually 1.</td>
</tr>
<tr>
<td>error in</td>
<td>is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.</td>
</tr>
<tr>
<td>status</td>
<td>is TRUE if an error occurred. This VI is not executed when status is TRUE.</td>
</tr>
<tr>
<td>code</td>
<td>is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. </tr>
<tr>
<td>source</td>
<td>identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
Output

- **diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.
- **seed out** returns the seed from the ECU.
- **success?** indicates successful receipt of a positive response message for this diagnostic service.
- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

- **source** identifies the VI where the error occurred.

Description

The usual procedure for getting a security access to the ECU is as follows:

1. Request a seed from the ECU using **RequestSeed.vi** with access mode = \( n \).
2. From the seed, compute a key for the ECU on the host.
3. Send the key to the ECU using **SendKey.vi** with access mode = \( n + 1 \).
4. The security access is granted if the ECU validates the key sent. Otherwise, an error is returned.
SendKey.vi

Purpose
Executes the SecurityAccess service to send a key to the ECU.

Format

```
diag ref in  
access mode  
key in  
error in (no error)  
```

```
diag ref out  
status  
code  
source
```

Input

**diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

**access mode** indicates the security level to be granted. The values are application specific. This is an even number, usually 2.

**key in** defines the key data to be sent to the ECU.

**error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

**status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

The usual procedure for getting a security access to the ECU is as follows:

1. Request a seed from the ECU using RequestSeed.vi with access mode = $n$.
2. From the seed, compute a key for the ECU on the host.
3. Send the key to the ECU using SendKey.vi with access mode = $n + 1$.
4. The security access is granted if the ECU validates the key sent. Otherwise, an error is returned.
Chapter 5  Automotive Diagnostic Command Set API for LabVIEW

StartDiagnosticSession.vi

Purpose
Executes the StartDiagnosticSession service. Sets up the ECU in a specific diagnostic mode.

Format

```
input
  diag ref in
  mode
  error in (no error)

output
  diag ref out
  success?
  error out
```

Input

`diag ref in` specifies the diagnostic session handle, obtained from `Open Diagnostic.vi` or `Open Diagnostic on IP.vi` and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

`mode` indicates the diagnostic mode into which the ECU is brought. The values are application specific.

`error in` is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the `error in` cluster to `error out`.

`status` is TRUE if an error occurred. This VI is not executed when status is TRUE.

`code` is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the `code`, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

`source` identifies the VI where the error occurred.
Chapter 5  Automotive Diagnostic Command Set API for LabVIEW

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI enables different diagnostic modes in the ECU. The possible diagnostic modes are not defined in the ISO 14230 standard and are application specific. A diagnostic session starts only if communication with the ECU is established. For more details about starting communication, refer to the ISO 14230-2 standard. If no diagnostic session has been requested after Open Diagnostic.vi, a default session is automatically enabled in the ECU. The default session supports at least the following services:

- The StopCommunication service (refer to Close Diagnostic.vi and the ISO 14230-2 standard).
- The TesterPresent service (refer to TesterPresent.vi and the ISO 14230-3 standard).
StartRoutineByLocalIdentifier.vi

Purpose
Executes the StartRoutineByLocalIdentifier service. Executes a routine on the ECU.

Format

<table>
<thead>
<tr>
<th>Input</th>

© National Instruments Corporation 5-97 Automotive Diagnostic Command Set User Manual
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

data out returns application-specific output parameters from the routine.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI starts a routine in the ECU memory. The routine in the ECU starts after the positive response message is sent. The routine stops until StopRoutineByLocalIdentifier.vi is issued. The routines could be either tests run instead of normal operating code or routines enabled and executed with the normal operating code running. In the first case, you may need to switch the ECU to a specific diagnostic mode using StartDiagnosticSession.vi or unlock the ECU using the SecurityAccess service prior to using StartRoutineByLocalIdentifier.vi.

For further details about this service, refer to the ISO 14230-3 standard.
StopDiagnosticSession.vi

**Purpose**
Executes the StopDiagnosticSession service. Returns the ECU to normal mode.

**Format**

```plaintext
<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>

</tr>
</tbody>
</table>
```

**Example**

```plaintext
StopDiagnosticSession.vi
```
**Output**

-diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

-succcess? indicates successful receipt of a positive response message for this diagnostic service.

-error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

-status is TRUE if an error occurred.

-code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

-source identifies the VI where the error occurred.

**Description**

This VI disables the current ECU diagnostic mode. A diagnostic session stops only if communication is established with the ECU and a diagnostic session is running. If no diagnostic session is running, the default session is active. StopDiagnosticSession.vi cannot disable the default session. If the ECU has stopped the current diagnostic session, it performs the necessary action to restore its normal operating conditions. Restoring the normal operating conditions of the ECU may include resetting all controlled actuators if they were activated during the diagnostic session being stopped, and resuming all normal ECU algorithms. You should call StopDiagnosticSession.vi before disabling communication with Close Diagnostic.vi, but only if you previously used StartDiagnosticSession.vi.
StopRoutineByLocalIdentifier.vi

Purpose
Executes the StopRoutineByLocalIdentifier service. Stops a routine on the ECU.

Format

```
<table>

© National Instruments Corporation
5-103
Automotive Diagnostic Command Set User Manual
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

To ensure proper ECU operation, you may need to keep the ECU informed that a diagnostic session is still in progress. If you do not send this information (for example, because the communication is broken), the ECU returns to normal mode from diagnostic mode after a while.

The TesterPresent service is this “keep alive” signal. It does not affect any other ECU operation.

Keep calling TesterPresent.vi within the ECU timeout period if no other service is executed.
WriteDataByLocalIdentifier.vi

Purpose
Executes the WriteDataByLocalIdentifier service. Writes a data record to the ECU.

Format

```
data in
  diag ref in
  local ID
  error in (no error)
  diag ref out
  success?
  status
  code
  source
```

Input
- **data in** defines the data record written to the ECU. If you know the record data description, you can use Convert from Phys.vi to generate this record.
- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
- **local ID** defines the local identifier of the data to be written. The values are application specific.
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.
- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
- **source** identifies the VI where the error occurred.
Output

- **diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.
- **success?** indicates successful receipt of a positive response message for this diagnostic service.
- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

  - **status** is TRUE if an error occurred.
  - **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
  - **source** identifies the VI where the error occurred.

Description

This VI performs the KWP2000 WriteDataByLocalIdentifier service and writes RecordValues (data values) to the ECU. **data in** identifies the data. The vehicle manufacturer must ensure the ECU conditions are met when performing this service. Typical use cases are clearing nonvolatile memory, resetting learned values, setting option content, setting the Vehicle Identification Number, or changing calibration values.

For further details about this service, refer to the ISO 14230-3 standard.
WriteMemoryByAddress.vi

Purpose
Executes the WriteMemoryByAddress service. Writes data to the ECU memory.

Format

| data in | defines the memory block to be written to the ECU. |
| diag ref in | specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster. |
| address | defines the memory address to which data are written. Notice that only three bytes are sent to the ECU, so the address must be in the range 0–FFFFFF (hex). |
| size | defines the length of the memory block to be written. |
| error in | is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out. |

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI performs the KWP2000 WriteDataByAddress service and writes RecordValues (data values) to the ECU. address and size identify the data. The vehicle manufacturer must ensure the ECU conditions are met when performing this service. Typical use cases are clearing nonvolatile memory, resetting learned values, setting option content, setting the Vehicle Identification Number, or changing calibration values.

For further details about this service, refer to the ISO 14230-3 standard.
UDS (DiagOnCAN) Services

UDS ClearDiagnosticInformation.vi

**Purpose**
Executes the UDS ClearDiagnosticInformation service. Clears selected Diagnostic Trouble Codes (DTCs).

**Format**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DTC descriptor</td>
<td>is a cluster that describes the DTC records the ECU delivers:</td>
</tr>
<tr>
<td>DTC Byte Length</td>
<td>indicates the number of bytes the ECU sends for each DTC. The default is 2.</td>
</tr>
<tr>
<td>Status Byte Length</td>
<td>indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.</td>
</tr>
<tr>
<td>Add Data Byte Length</td>
<td>indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there is no additional data, so the default is 0.</td>
</tr>
<tr>
<td>Byte Order</td>
<td>indicates the byte ordering for multibyte items:</td>
</tr>
<tr>
<td>0: MSB_FIRST (Motorola) (default)</td>
<td></td>
</tr>
<tr>
<td>1: LSB_FIRST (Intel)</td>
<td></td>
</tr>
</tbody>
</table>

The DTC descriptor is given here as a parameter basically to convert the group of DTC parameter to a binary representation according to DTC Byte Length and Byte Order.

| diag ref in | specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster. |
**group of DTC** specifies the group of Diagnostic Trouble Codes to be cleared. The values are application specific. The following value has a special meaning, and you can specify it through a ring control:

0xFFFFFFFF  All DTCs

**error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

**status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Output**

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.
**Description**

This VI clears the diagnostic information on the ECU memory. If the **group of DTC** parameter is present, the ECU is requested to clear all memory including the DTCs.

For further details about this service, refer to the ISO 15765-3 standard.
UDS CommunicationControl.vi

Purpose
Executes the UDS CommunicationControl service. Use this VI to switch transmission and/or reception of the normal communication messages (usually CAN messages) on or off.

Format

```
diag ref in
  type
  communication type
  error in (no error)
```

```
diag ref out
  success?
  error out
```

Input

diag ref in specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

type indicates whether transmission/reception is to be switched on/off. The usual values are:
00: enableRxAndTx
01: enableRxAndDisableTx
02: disableRxAndEnableTx
03: disableRxAndTx

communication type is a bitfield indicating the application level to change. The usual values are:
01: application
02: networkManagement

You can change more than one level at a time.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.
code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI executes the UDS CommunicationControl service and switches transmission and/or reception of the normal communication messages (usually CAN messages) on or off. The type and communication type parameters are vehicle manufacturer specific (one OEM may disable the transmission only, while another OEM may disable the transmission and the reception based on vehicle manufacturer specific needs). The request is either transmitted functionally addressed to all ECUs with a single request message, or transmitted physically addressed to each ECU in a separate request message.
**UDS ControlDTCSetting.vi**

**Purpose**
Executes the UDS ControlDTCSetting service. Modifies Diagnostic Trouble Code (DTC) generation behavior.

**Format**

```
    diag ref in    data in
    type          success?
    error in (no error)
    diag ref out  status
    code
    source
```

**Input**

- `diag ref in` specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

- `data in` specifies application-specific data that control DTC generation.

- `type` specifies the control mode:
  1: on
  2: off

- `error in` is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the `error in` cluster to `error out`.

- `status` is TRUE if an error occurred. This VI is not executed when status is TRUE.

- `code` is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

- `source` identifies the VI where the error occurred.
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
**UDS DiagnosticSessionControl.vi**

**Purpose**

Executes the UDS DiagnosticSessionControl service. Sets up the ECU in a specific diagnostic mode.

**Format**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>diag ref in</strong></td>
<td>specifies the diagnostic session handle, obtained from <strong>Open Diagnostic.vi</strong> or <strong>Open Diagnostic on IP.vi</strong> and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>
</tr>
<tr>
<td><strong>mode</strong></td>
<td>indicates the diagnostic mode into which the ECU is brought. The values are application specific. The usual values are: 01: defaultSession 02: ECUProgrammingSession 03: ECUExtendedDiagnosticSession</td>
</tr>
<tr>
<td><strong>error in</strong></td>
<td>is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the <strong>error in</strong> cluster to <strong>error out</strong>.</td>
</tr>
</tbody>
</table>

**Output**

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**session parameter record** returns implementation-dependent data from the ECU.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.
UDS ECURest.vi

Purpose
Executes the UDS ECURest service. Resets the ECU.

Format

```plaintext
Input

- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

- **mode** indicates the reset mode:
  
<table>
<thead>
<tr>
<th>Hex</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>hardReset</td>
</tr>
<tr>
<td>02</td>
<td>keyOffOnReset</td>
</tr>
<tr>
<td>03</td>
<td>softReset</td>
</tr>
<tr>
<td>04</td>
<td>enableRapidPowerShutDown</td>
</tr>
<tr>
<td>05</td>
<td>disableRapidPowerShutDown</td>
</tr>
</tbody>
</table>

- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to
```
a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Output**

- **diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

- **power down time** returns the minimum standby sequence time that the server remains in the power-down sequence in seconds. A value of FF hex indicates a failure or time not available.

- **success?** indicates successful receipt of a positive response message for this diagnostic service.

- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

  - **status** is TRUE if an error occurred.

  - **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

  - **source** identifies the VI where the error occurred.

**Description**

This VI requests the ECU to perform an ECU reset effectively based on the **mode** parameter value content. The vehicle manufacturer determines when the positive response message is sent.

For further details about this service, refer to the ISO 15765-3 standard.
UDS InputOutputControlByIdentifier.vi

Purpose
Executes the UDS InputOutputControlByIdentifier service. Modifies ECU I/O port behavior.

Format

<table>
<thead>
<tr>
<th>data in</th>
<th>diag ref in</th>
<th>diag ref out</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ID</td>
<td>data out</td>
</tr>
<tr>
<td>mode</td>
<td></td>
<td>success?</td>
</tr>
<tr>
<td>error in (no error)</td>
<td>diag ref out</td>
<td>error out</td>
</tr>
</tbody>
</table>

Input

data in defines application specific data for this service.
diag ref in specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
ID defines the identifier of the I/O to be manipulated. The values are application specific.
mode defines the I/O control type. The values are application specific. The usual values are:
0: ReturnControlToECU
1: ResetToDefault
2: FreezeCurrentState
3: ShortTermAdjustment
error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.
status is TRUE if an error occurred. This VI is not executed when status is TRUE.
Chapter 5   Automotive Diagnostic Command Set API for LabVIEW

**Output**

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

- **source** identifies the VI where the error occurred.

- **diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

- **data out** returns application-specific data for this service.

- **success?** indicates successful receipt of a positive response message for this diagnostic service.

- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

- **source** identifies the VI where the error occurred.

**Description**

This VI substitutes a value for an input signal or internal ECU function. It also controls an output (actuator) of an electronic system referenced by the **local ID** parameter.

For further details about this service, refer to the ISO 15765-3 standard.
Chapter 5   Automotive Diagnostic Command Set API for LabVIEW

UDS ReadDataByIdentifier.vi

Purpose
Executes the UDS ReadDataByIdentifier service. Reads a data record from the ECU.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>diag ref in</strong></td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>
</tr>
<tr>
<td><strong>ID</strong></td>
<td>defines the identifier of the data to be read. The values are application specific.</td>
</tr>
<tr>
<td><strong>error in</strong></td>
<td>is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the <strong>error in</strong> cluster to <strong>error out</strong>.</td>
</tr>

</tr>
<tr>
<td><strong>source</strong></td>
<td>identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**data out** returns the data record from the ECU. If you know the record data description, you can use Convert to Phys.vi to interpret this record.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

**source** identifies the VI where the error occurred.

Description

This VI requests data record values from the ECU identified by the **ID** parameter.

For further details about this service, refer to the ISO 15765-3 standard.
UDS ReadMemoryByAddress.vi

Purpose
Executes the UDS ReadMemoryByAddress service. Reads data from the ECU memory.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>

</tr>
<tr>
<td>source</td>
<td>Identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

data out returns the ECU memory data.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI requests ECU memory data identified by the address and size parameters. The data out format and definition are vehicle manufacturer specific. data out includes analog input and output signals, digital input and output signals, internal data, and system status information if the ECU supports them.

For further details about this service, refer to the ISO 15765-3 standard.
UDS ReportDTCBySeverityMaskRecord.vi

Purpose
Executes the ReportDTCBySeverityMaskRecord subfunction of the UDS ReadDiagnosticTroubleCodeInformation service. Reads selected Diagnostic Trouble Codes (DTCs).

Format

```plaintext
DTC descriptor

<table>
<thead>
<tr>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>DTC descriptor</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>DTC Byte Length</td>
</tr>
<tr>
<td>Status Byte Length</td>
</tr>
<tr>
<td>Add Data Byte Length</td>
</tr>
<tr>
<td>Byte Order</td>

<tr>
<td></td>
</tr>
<tr>
<td>0: MSB_FIRST (Motorola) (default)</td>
</tr>
<tr>
<td>1: LSB_FIRST (Intel)</td>
</tr>
</tbody>
</table>
```

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs cluster array.

**diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
severity mask defines the status of DTCs to be read. The values are application specific.

status defines the status of DTCs to be read. The values are application specific.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

DTCs returns the resulting DTCs as an array of clusters:

DTC is the resulting Diagnostic Trouble Code.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>

<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
</tbody>
</table>
7 warningIndicatorRequested

Add Data contains optional additional data for this DTC.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

status avail mask is an application-specific value returned for all DTCs.

Description
This VI executes the ReportDTCBySeverityMaskRecord subfunction of the UDS ReadDiagnosticTroubleCodeInformation service and reads the selected DTCs.

For further details about this service, refer to the ISO 15765-3 standard.
UDS ReportDTCByStatusMask.vi

Purpose
Executes the ReportDTCByStatusMask subfunction of the UDS ReadDiagnosticTroubleCodeInformation service. Reads selected Diagnostic Trouble Codes (DTCs).

Format
DTC descriptor

DTC descriptor is a cluster that describes the DTC records the ECU delivers:

- **DTC Byte Length** indicates the number of bytes the ECU sends for each DTC. The default is 3 for UDS.
- **Status Byte Length** indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.
- **Add Data Byte Length** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there is no additional data, so the default is 0.
- **Byte Order** indicates the byte ordering for multibyte items:
  0: MSB_FIRST (Motorola) (default)
  1: LSB_FIRST (Intel)

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the **DTCs** cluster array.

**diag ref in** specifies the diagnostic session handle, obtained from **Open Diagnostic.vi** or **Open Diagnostic on IP.vi** and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
status mask defines the status of DTCs to be read. The values are application specific.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

DTCs returns the resulting DTCs as an array of clusters:

DTC is the resulting Diagnostic Trouble Code.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>

**Add Data** contains optional additional data for this DTC. Usually, this does not contain valid information (refer to **DTC descriptor**).

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is **TRUE** if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**status avail mask** is an application-specific value returned for all DTCs.

**Description**

This VI executes the ReportDTCByStatusMask subfunction of the UDS ReadDiagnosticTroubleCodeInformation service and reads the selected DTCs from the ECU.

For further details about this service, refer to the ISO 15765-3 standard.
UDS ReportSeverityInformationOfDTC.vi

Purpose
Executes the ReportSeverityInformationOfDTC subfunction of the UDS ReadDiagnosticTroubleCodeInformation service. Reads selected Diagnostic Trouble Codes (DTCs).

Format

Input
- **DTC descriptor** is a cluster that describes the DTC records the ECU delivers:
  - **DTC Byte Length** indicates the number of bytes the ECU sends for each DTC. The default is 3 for UDS.
  - **Status Byte Length** indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.
  - **Add Data Byte Length** indicates the number of bytes the ECU sends for each DTC’s additional data. For this subfunction, the default is 2.
  - **Byte Order** indicates the byte ordering for multibyte items:
    - 0: MSB_FIRST (Motorola) (default)
    - 1: LSB_FIRST (Intel)

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the **DTCs** cluster array.

**diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
DTC mask record defines the status of DTCs to be read. The values are application specific.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

DTCs returns the resulting DTCs as an array of clusters:

DTC is the resulting Diagnostic Trouble Code.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>

</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>
Add Data contains optional additional data for this DTC.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

status avail mask is an application-specific value returned for all DTCs.

Description

This VI executes the ReportSeverityInformationOfDTC subfunction of the UDS ReadDiagnosticTroubleCodeInformation service and reads the selected DTCs from the ECU memory.

For further details about this service, refer to the ISO 15765-3 standard.
UDS ReportSupportedDTCs.vi

Purpose

Executes the ReportSupportedDTCs subfunction of the UDS ReadDiagnosticTroubleCodeInformation service. Reads all supported Diagnostic Trouble Codes (DTCs).

Format

![Diagram]

**Input**

- **DTC descriptor** is a cluster that describes the DTC records the ECU delivers:
  - **DTC Byte Length** indicates the number of bytes the ECU sends for each DTC. The default is 3 for UDS.
  - **Status Byte Length** indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.
  - **Add Data Byte Length** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there is no additional data, so the default is 0.
  - **Byte Order** indicates the byte ordering for multibyte items:
    - 0: MSB_FIRST (Motorola) (default)
    - 1: LSB_FIRST (Intel)

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the **DTCs** cluster array.

- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
Chapter 5  Automotive Diagnostic Command Set API for LabVIEW

**error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

**status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. </tr>
</tbody>
</table>

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.
source identifies the VI where the error occurred.

memory address length defines the number of bytes of the memory address parameter that are written to the ECU. This value is implementation dependent and must be in the range of 1–4. For example, if this value is 2, only the two lowest bytes of the address are written to the ECU.

memory size length defines the number of bytes of the memory size parameter that are written to the ECU. This value is implementation dependent and must be in the range of 1–4. For example, if this value is 2, only the two lowest bytes of the size are written to the ECU.

Output

diag ref out is a copy of diag ref in. It can be wired to subsequent diagnostic VIs.

block size returns the number of data bytes to be transferred to the ECU in subsequent UDS TransferData.vi requests.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

UDS RequestDownload.vi initiates the download of a data block to the ECU. This is required to set up the download process; the actual data transfer occurs with subsequent UDS TransferData.vi requests. The transfer must occur in blocks of the size that this service returns (the block size parameter). After the download completes, use the UDS RequestTransferExit.vi service to terminate the process.
UDS RequestSeed.vi

**Purpose**
Executes the UDS SecurityAccess service to retrieve a seed from the ECU.

**Format**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>diag ref in</strong></td>

</tr>
<tr>
<td><strong>source</strong></td>
<td>identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**seed out** returns the seed from the ECU.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

Description

The usual procedure for getting a security access to the ECU is as follows:

1. Request a seed from the ECU using **UDS RequestSeed.vi** with access mode = $n$.
2. From the seed, compute a key for the ECU on the host.
3. Send the key to the ECU using **UDS SendKey.vi** with access mode = $n + 1$.
4. The security access is granted if the ECU validates the key sent. Otherwise, an error is returned.
**UDS RequestTransferExit.vi**

**Purpose**
Terminates a download/upload process.

**Format**

```
Input  

**diag ref in** specifies the diagnostic session handle, obtained from **Open Diagnostic.vi** or **Open Diagnostic on IP.vi** and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

**data in** defines a data record to be written to the ECU as part of the termination process. The meaning is implementation dependent; this might be a checksum or a similar verification instrument.

**error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

**status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.
```
Output

**diag ref out** is a copy of **diag ref in**. It can be wired to subsequent diagnostic VIs.

**data out** returns a memory data block from the ECU as part of the termination process. The meaning is implementation dependent; this might be a checksum or a similar verification instrument.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

Description

**UDS RequestTransferExit.vi** terminates a download or upload process initialized with **UDS RequestDownload.vi** or **UDS RequestUpload.vi**.
UDS RequestUpload.vi

Purpose

Initiates an upload of data from the ECU.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data format identifier</td>
<td>defines the compression and encryption scheme to be used for the data blocks read from the ECU. A value of 0 means no compression/no encryption. Nonzero values are not standardized and implementation dependent.</td>

</tr>
</tbody>
</table>
```

error out is a cluster that describes error conditions occurring after the VI executes. If an error occurs, the VI returns the value of the error out cluster to error in.
source identifies the VI where the error occurred.

memory address length defines the number of bytes of the
memory address parameter that are written to the ECU. This value is
implementation dependent and must be in the range of 1–4. For example,
if this value is 2, only the two lowest bytes of the address are written to
the ECU.

memory size length defines the number of bytes of the memory size
parameter that are written to the ECU. This value is implementation
dependent and must be in the range of 1–4. For example, if this value is 2,
only the two lowest bytes of the size are written to the ECU.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent
diagnostic VIs.

block size returns the number of data bytes to be transferred from the ECU
in subsequent UDS TransferData.vi requests.

success? indicates successful receipt of a positive response message for
this diagnostic service.

error out describes error conditions. If the error in cluster indicated an
error, the error out cluster contains the same information. Otherwise,
error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0
means success. A negative value means error: the VI did not
execute the intended operation. A positive value means warning:
the VI executed intended operation, but an informational warning
is returned. For a description of the code, wire the error cluster to
a LabVIEW error-handling VI, such as the Simple Error
Handler.

source identifies the VI where the error occurred.

Description

UDS RequestUpload.vi initiates the upload of a data block from the ECU. This is required
to set up the upload process; the actual data transfer occurs with subsequent UDS
TransferData.vi requests. The transfer must occur in blocks of the size that this service
returns (the block size parameter). After the upload completes, use the UDS
RequestTransferExit.vi service to terminate the process.
UDS RoutineControl.vi

Purpose
Executes the UDS RoutineControl service. Executes a routine on the ECU.

Format

Input
- **mode** defines the service operation mode. You can obtain the values from a ring control:
  - 1: Start Routine
  - 2: Stop Routine
  - 3: Request Routine Results
  - Other values are application specific.
- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
- **ID** defines the identifier of the routine to be started. The values are application specific.
- **data in** defines application-specific input parameters for the routine.
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.
- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

data out returns application-specific output parameters from the routine.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI executes the UDS RoutineControl service and launches an ECU routine, stops an ECU routine, or requests ECU routine results from the ECU.

For further details about this service, refer to the ISO 15765-3 standard.
UDS SendKey.vi

Purpose
Executes the SecurityAccess service to send a key to the ECU.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>

```

Output

Collection: diag ref out

```
success? = 1, status = error out
```

Collection: key out

error in
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

Description

The usual procedure for getting a security access to the ECU is as follows:

1. Request a seed from the ECU using **UDS RequestSeed.vi** with access mode = \( n \).
2. From the seed, compute a key for the ECU on the host.
3. Send the key to the ECU using **UDS SendKey.vi** with access mode = \( n + 1 \).
4. The security access is granted if the ECU validates the key sent. Otherwise, an error is returned.
Chapter 5  Automotive Diagnostic Command Set API for LabVIEW

UDS TesterPresent.vi

Purpose
Executes the UDS TesterPresent service. Keeps the ECU in diagnostic mode.

Format

<table>
<thead>
<tr>
<th>diag ref in</th>
<th>response required?</th>
<th>diag ref out</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>error in</td>
<td>success?</td>
<td>error out</td>
</tr>
<tr>
<td></td>
<td>(no error)</td>
<td></td>
</tr>
</tbody>
</table>

Input

- **diag ref in**: Specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

- **response required?**: Indicates whether the ECU answers this service (TRUE, default) or not (FALSE). In the latter case, success? is TRUE.

- **error in**: Is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

- **status**: Is TRUE if an error occurred. This VI is not executed when status is TRUE.

- **code**: Is the error code number identifying an error. A value of 0 means success. A negative value means error; the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

- **source**: Identifies the VI where the error occurred.
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

To ensure proper ECU operation, you may need to keep the ECU informed that a diagnostic session is still in progress. If you do not send this information (for example, because the communication is broken), the ECU returns to normal mode from diagnostic mode after a while.

The TesterPresent service is this “keep alive” signal. It does not affect any other ECU operation.

Keep calling UDS TesterPresent.vi within the ECU timeout period if no other service is executed.
UDS TransferData.vi

Purpose

Transfers data to/from the ECU in a download/upload process.

Format

```
block sequence counter in  block sequence counter out
  diag ref in  diag ref out
  data in    data out
  error in (no error)  success?
```

Input

- **block sequence counter in** is used to number the data blocks to be transferred to/from the ECU. The block sequence counter value starts at 01 hex with the first UDS TransferData.vi request that follows the UDS RequestDownload.vi or UDS RequestUpload.vi service. Its value is incremented by 1 for each subsequent UDS TransferData.vi request. At the value of FF hex, the block sequence counter rolls over and starts at 00 hex with the next UDS TransferData.vi request.

  The block sequence counter is updated automatically and returned in the block sequence counter out parameter.

- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

- **data in** defines the data block to be written to the ECU.

For a download, this is a memory data block to be downloaded to the ECU.

For an upload, the meaning is implementation dependent; in most cases, it is sufficient to leave the parameter empty (default).

- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
**Output**

- **block sequence counter out** returns the updated value of the block sequence counter.

- **diag ref out** is a copy of **diag ref in**. It can be wired to subsequent diagnostic VIs.

- **data out** returns the memory data from the ECU.
  
  For a download, this might contain a checksum or similar verification instrument; the meaning is implementation dependent.
  
  For an upload, this is a memory data block uploaded from the ECU.

- **success?** indicates successful receipt of a positive response message for this diagnostic service.

- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

- **source** identifies the VI where the error occurred.
Description

**UDS TransferData.vi** executes the data transfer of a download process (initiated with a previous **UDS RequestDownload.vi** request) or an upload process (initiated with a previous **UDS RequestUpload.vi** request). The data transfer must occur in blocks of the size returned in the **block size** parameter of the respective request service. After the data transfer has completed, terminate the operation by calling the **UDS RequestTransferExit.vi** service.
UDS WriteDataByIdentifier.vi

Purpose
Executes the UDS WriteDataByIdentifier service. Writes a data record to the ECU.

Format

```
data in
  diag ref in
    ID
  error in (no error)

  diag ref out
    status
  success?
  error out
```

Input

- **data in** defines the data record to be written to the ECU. If you know the the data description record, you can use Convert from Phys.vi to generate this record.

- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

- **ID** defines the identifier of the data to be written. The values are application specific.

- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

- **source** identifies the VI where the error occurred.
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

- **status** is TRUE if an error occurred.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.

Description

This VI performs the UDS service WriteDataByIdentifier and writes RecordValues (data values) to the ECU. **data in** identifies the data. The vehicle manufacturer must ensure the ECU conditions are met when performing this service. Typical use cases are clearing nonvolatile memory, resetting learned values, setting option content, setting the Vehicle Identification Number, or changing calibration values.

For further details about this service, refer to the 15765-3 standard.
UDS WriteMemoryByAddress.vi

Purpose
Executes the UDS WriteMemoryByAddress service. Writes data to the ECU memory.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data in</td>
<td>defines the memory block to be written to the ECU.</td>

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

This VI performs the UDS service WriteMemoryByAddress and writes RecordValues (data values) to the ECU. address and size identify the data. The vehicle manufacturer must ensure the ECU conditions are met when performing this service. Typical use cases are clearing nonvolatile memory, resetting learned values, setting option content, setting the Vehicle Identification Number, or changing calibration values.

For further details about this service, refer to the ISO 15765-3 standard.
UDS06 ReadMemoryByAddress.vi

Purpose
Executes the UDS ReadMemoryByAddress service. Reads data from the ECU memory.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VI's. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>

© National Instruments Corporation 5-159 Automotive Diagnostic Command Set User Manual
source identifies the VI where the error occurred.

memory address length specifies how many bytes of the address are sent to the ECU. The default is 4.

memory size length specifies how many bytes of the size are sent to the ECU. The default is 4.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

data out returns the memory data from the ECU.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Description

Similar to UDS ReadMemoryByAddress.vi. You can define the size in bytes of the address and size parameters (the default is 4).
Chapter 5  Automotive Diagnostic Command Set API for LabVIEW

UDS06 WriteMemoryByAddress.vi

Purpose
Executes the UDS WriteMemoryByAddress service. Writes data to the ECU memory.

Format

```
data in

diag ref in

memory address

memory size

error in (no error)

memory address length

memory size length
```

Input

- **data in** defines the memory block to be written to the ECU.
- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
- **memory address** defines the memory address to which data are to be sent. Note that **memory address length** specifies how many bytes of the address are sent to the ECU. This defines the maximum address you can use.
- **memory size** defines the length of the memory block to be sent. Note that **memory size length** specifies how many bytes of the size are sent to the ECU. This defines the maximum size you can use.
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.
- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to...
a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**memory address length** specifies how many bytes of the address are sent to the ECU. The default is 4.

**memory size length** specifies how many bytes of the size are sent to the ECU. The default is 4.

**Output**

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Description**

Similar to **UDS WriteMemoryByAddress.vi**. You can define the size in bytes of the address and size parameters (the default is 4).
OBD (On-Board Diagnostics) Services

OBD Clear Emission Related Diagnostic Information.vi

Purpose
Executes the OBD Clear Emission Related Diagnostic Information service. Clears emission-related Diagnostic Trouble Codes (DTCs) in the ECU.

Format

```
<table>

source identifies the VI where the error occurred.
OBD Request Control Of On-Board Device.vi

Purpose
Executes the OBD Request Control Of On-Board Device service. Modifies ECU I/O port behavior.

Format

data in
diag ref in
TID
diag ref out
data out
error in (no error)
success?
error out

Input

data in defines application-specific data for this service.

diag ref in specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

TID defines the test identifier of the I/O to be manipulated. The values are application specific.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**data out** returns application-specific data for this service.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.
OBD Request Current Powertrain Diagnostic Data.vi

Purpose
Executes the OBD Request Current Powertrain Diagnostic Data service. Reads a data record from the ECU.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>

</table>

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the **DTCs** cluster array.

**diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
**error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.

**status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.

**Output**

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**DTCs** returns the resulting DTCs as an array of clusters:

**DTC** is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, you can use **DTC to String.vi** to convert this to readable format as defined by SAE J2012.

**Status** is the DTC status. Usually, this is a bit field with the following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>

</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

For OBD, this field usually does not contain valid information.
Add Data contains optional additional data for this DTC. Usually, this does not contain valid information (refer to DTC descriptor).

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
OBD Request Emission Related DTCs During Current Drive Cycle.vi

Purpose
Executes the OBD Request Emission Related DTCs During Current Drive Cycle service. Reads the emission-related Diagnostic Trouble Codes (DTCs) that occurred during the current (or last completed) drive cycle.

Format

Input

DTC descriptor is a cluster that describes the DTC records the ECU delivers:

- **DTC Byte Length** indicates the number of bytes the ECU sends for each DTC. The default is 2.
- **Status Byte Length** indicates the number of bytes the ECU sends for each DTC’s status. The default is 0 for OBD.
- **Add Data Byte Length** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there is no additional data, so the default is 0.
- **Byte Order** indicates the byte ordering for multibyte items:
  - 0: MSB_FIRST (Motorola) (default)
  - 1: LSB_FIRST (Intel)

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs cluster array.

diag ref in specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.

status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

DTCs returns the resulting DTCs as an array of clusters:

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, you can use DTC to String.vi to convert this to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with the following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>

<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

For OBD, this field usually does not contain valid information.
Add Data contains optional additional data for this DTC. Usually, this does not contain valid information (refer to DTC descriptor).

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
OBD Request On-Board Monitoring Test Results.vi

Purpose
Executes the OBD Request On-Board Monitoring Test Results service. Reads a test data record from the ECU.

Format

```
+-----------------+-----------------+-----------------+
| diag ref in     | OBDMID          | error in        |
+-----------------+-----------------+-----------------+
| diag ref out    | data out        | success?        |
| error in (no error) |                 | error out       |
```

Input
- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
- **OBDMID** defines the parameter identifier of the data to be read. The SAE J1979 standard defines the values.
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.
- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.
- **source** identifies the VI where the error occurred.
Output

diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

data out returns the ECU data record. If you know the record data description, you can use Convert from Phys.vi to interpret this record. You can obtain the description from the SAE J1979 standard.

success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
OBD Request Permanent Fault Codes.vi

Purpose
Executes the OBD Request Permanent Fault Codes service. All permanent Diagnostic Trouble Codes (DTCs) are read.

Format

```
DTC descriptor

Input
DTC descriptor is a cluster that describes the DTC records the ECU delivers:

DTC Byte Length indicates the number of bytes the ECU sends for each DTC. The default is 2.

Status Byte Length indicates the number of bytes the ECU sends for each DTC's status. The default is 0 for OBD.

Add Data Byte Length indicates the number of bytes the ECU sends for each DTC's additional data. Usually, there is no additional data, so the default is 0.

Byte Order indicates the byte ordering for multibyte items:

0: MSB_FIRST (Motorola) (default)
1: LSB_FIRST (Intel)

This VI interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs cluster array.

diag ref in specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.

error in is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.
```
status is TRUE if an error occurred. This VI is not executed when status is TRUE.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.

Output
diag ref out is a copy of diag ref in. You can wire it to subsequent diagnostic VIs.

DTCs returns the resulting DTCs as an array of clusters:

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, you can use DTC to String.vi to convert this to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with the following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

For OBD, this field usually does not contain valid information.

Add Data contains optional additional data for this DTC. Usually, this does not contain valid information (refer to DTC descriptor).
success? indicates successful receipt of a positive response message for this diagnostic service.

error out describes error conditions. If the error in cluster indicated an error, the error out cluster contains the same information. Otherwise, error out describes the error status of this VI.

status is TRUE if an error occurred.

code is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

source identifies the VI where the error occurred.
OBD Request Powertrain Freeze Frame Data.vi

Purpose
Executes the OBD Request Powertrain Freeze Frame Data service. Reads an ECU data record stored while a Diagnostic Trouble Code occurred.

Format

```
Input

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
<td>Specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>
</tr>
<tr>
<td>PID</td>
<td>Defines the parameter identifier of the data to be read. The SAE J1979 standard defines the values.</td>
</tr>
<tr>
<td># frame</td>
<td>Is the number of the freeze frame from which the data are to be retrieved.</td>
</tr>
<tr>
<td>error in</td>
<td>Is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Is TRUE if an error occurred. This VI is not executed when status is TRUE.</td>
</tr>
<tr>
<td>code</td>
<td>Is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.</td>
</tr>
<tr>
<td>source</td>
<td>Identifies the VI where the error occurred.</td>
</tr>
</tbody>
</table>
```
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**data out** returns the ECU data record. If you know the record data description, you can use **Convert from Phys.vi** to interpret this record. You can obtain the description from the SAE J1979 standard.

**success?** indicates successful receipt of a positive response message for this diagnostic service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is TRUE if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.
OBD Request Supported PIDs.vi

Purpose
Executes the OBD Request Current Powertrain Diagnostic Data service to retrieve the valid PID values for this service.

Format

```
<table>
<thead>
<tr>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>diag ref in</td>
</tr>
<tr>
<td>error in</td>
</tr>
<tr>
<td>status</td>
</tr>
<tr>
<td>code</td>
</tr>
<tr>
<td>source</td>
</tr>
</tbody>
</table>

```

- **diag ref in** specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.
- **error in** is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the **error in** cluster to **error out**.
- **status** is TRUE if an error occurred. This VI is not executed when status is TRUE.
- **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.
- **source** identifies the VI where the error occurred.
Output

**diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

**PIDs out** returns an array of valid PIDs for the OBD Request Current Powertrain Diagnostic Data service.

**error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

**status** is **TRUE** if an error occurred.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

**source** identifies the VI where the error occurred.
Chapter 5  Automotive Diagnostic Command Set API for LabVIEW

OBD Request Vehicle Information.vi

Purpose
Executes the OBD Request Vehicle Information service. Reads a set of information data from the ECU.

Format

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>diag ref in</strong></td>
<td>specifies the diagnostic session handle, obtained from Open Diagnostic.vi or Open Diagnostic on IP.vi and wired through subsequent diagnostic VIs. Normally, it is not necessary to manually manipulate the elements of this cluster.</td>
</tr>
<tr>
<td><strong>info type</strong></td>
<td>defines the type of information to be read. The values are defined in the SAE J1979 standard.</td>
</tr>
<tr>
<td><strong>error in</strong></td>
<td>is a cluster that describes error conditions occurring before the VI executes. If an error has already occurred, the VI returns the value of the error in cluster to error out.</td>
</tr>
</tbody>
</table>

**status** is TRUE if an error occurred. This VI is not executed when status is TRUE.

**code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the code, wire the error cluster to a LabVIEW error-handling VI, such as the Simple Error Handler.

**source** identifies the VI where the error occurred.
**Output**

- **diag ref out** is a copy of **diag ref in**. You can wire it to subsequent diagnostic VIs.

- **data out** returns the vehicle information from the ECU. You can obtain the description from the SAE J1979 standard.

- **success?** indicates successful receipt of a positive response message for this diagnostic service.

- **error out** describes error conditions. If the **error in** cluster indicated an error, the **error out** cluster contains the same information. Otherwise, **error out** describes the error status of this VI.

  - **status** is TRUE if an error occurred.

  - **code** is the error code number identifying an error. A value of 0 means success. A negative value means error: the VI did not execute the intended operation. A positive value means warning: the VI executed intended operation, but an informational warning is returned. For a description of the **code**, wire the error cluster to a LabVIEW error-handling VI, such as the **Simple Error Handler**.

  - **source** identifies the VI where the error occurred.

- **# items** is the number of data items (not bytes) this service returns.
Automotive Diagnostic Command Set API for C

This chapter lists the Automotive Diagnostic Command Set API functions and describes their format, purpose, and parameters. Unless otherwise stated, each Automotive Diagnostic Command Set function suspends execution of the calling thread until it completes. The functions are listed alphabetically in four categories: general functions, KWP2000 services, UDS (DiagOnCAN) services, and OBD (On-Board Diagnostics) services.

Section Headings

The following are section headings found in the Automotive Diagnostic Command Set for C functions.

Purpose

Each function description includes a brief statement of the function purpose.

Format

The format section describes the function format for the C programming language.

Input and Output

The input and output sections list the function parameters.

Description

The description section gives details about the function purpose and effect.
List of Data Types

The following data types are used with the Automotive Diagnostic Command Set API for C functions.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>i8</td>
<td>8-bit signed integer</td>
</tr>
<tr>
<td>i16</td>
<td>16-bit signed integer</td>
</tr>
<tr>
<td>i32</td>
<td>32-bit signed integer</td>
</tr>
<tr>
<td>u8</td>
<td>8-bit unsigned integer</td>
</tr>
<tr>
<td>u16</td>
<td>16-bit unsigned integer</td>
</tr>
<tr>
<td>u32</td>
<td>32-bit unsigned integer</td>
</tr>
<tr>
<td>f32</td>
<td>32-bit floating-point number</td>
</tr>
<tr>
<td>f64</td>
<td>64-bit floating-point number</td>
</tr>
<tr>
<td>str</td>
<td>ASCII string represented as an array of characters terminated by null character (\0). This type is used with output strings. str is typically used in the Automotive Diagnostic Command Set API as a pointer to a string, as char*.</td>
</tr>
<tr>
<td>cstr</td>
<td>ASCII string represented as an array of characters terminated by null character (\0). This type is used with input strings. cstr is typically used in the Automotive Diagnostic Command Set as a pointer to a string, as const char*.</td>
</tr>
</tbody>
</table>
List of Functions

The following table contains an alphabetical list of the Automotive Diagnostic Command Set API functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ndClearDiagnosticInformation</td>
<td>Executes the ClearDiagnostic Information service. Clears selected Diagnostic Trouble Codes (DTCs).</td>
</tr>
<tr>
<td>ndCloseDiagnostic</td>
<td>Closes a diagnostic session.</td>
</tr>
<tr>
<td>ndControlDTCSetting</td>
<td>Executes the ControlDTCSetting service. Modifies the generation behavior of selected Diagnostic Trouble Codes (DTCs).</td>
</tr>
<tr>
<td>ndConvertFromPhys</td>
<td>Converts a physical data value into a binary representation using a type descriptor.</td>
</tr>
<tr>
<td>ndConvertToPhys</td>
<td>Converts a binary representation of a value into its physical value using a type descriptor.</td>
</tr>
<tr>
<td>ndCreateExtendedCANIds</td>
<td>Creates diagnostic CAN identifiers according to ISO 15765-2.</td>
</tr>
<tr>
<td>ndDiagFrameRecv</td>
<td>Receives a raw CAN frame on the diagnostic CAN ID to check for errors in the transport protocol implementation of an ECU.</td>
</tr>
<tr>
<td>ndDiagFrameSend</td>
<td>Sends a raw CAN frame on the diagnostic CAN ID to check for errors in the transport protocol implementation of an ECU.</td>
</tr>
</tbody>
</table>
### Table 6-2. Functions for the Automotive Diagnostic Command Set for C (Continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ndDiagnosticService</td>
<td>Executes a generic diagnostic service. If a special service is not available through the KWP2000, UDS, or OBD service functions, you can build it using this function.</td>
</tr>
<tr>
<td>ndDisableNormalMessageTransmission</td>
<td>Executes the DisableNormalMessage Transmission service. The ECU no longer transmits its regular communication messages (usually CAN messages).</td>
</tr>
<tr>
<td>ndDoIPActivateRouting</td>
<td>Defines the source and target address for a DoIP TCP/IP connection.</td>
</tr>
<tr>
<td>ndDoIPConnect</td>
<td>Creates a TCP/IP connection to a DoIP entity identified by its IP address.</td>
</tr>
<tr>
<td>ndDoIPDisconnect</td>
<td>Disconnects the TCP/IP connection to a DoIP entity.</td>
</tr>
<tr>
<td>ndDoIPEntityStatus</td>
<td>Gets status information from a DoIP entity.</td>
</tr>
<tr>
<td>ndDoIPGetDiagPowerMode</td>
<td>Gets information on the DoIP entity power state.</td>
</tr>
<tr>
<td>ndDoIPGetEntities</td>
<td>Returns a table of all DoIP entities (vehicles) on the local subnet, possibly restricted to EID or VIN.</td>
</tr>
<tr>
<td>ndDoIPSendVehicleIdentRequest</td>
<td>Sends a UDP request to all DoIP-capable vehicles in the local subnet to identify themselves.</td>
</tr>
<tr>
<td>ndDoIPSendVehicleIdentReqEID</td>
<td>Sends a UDP request to all DoIP-capable vehicles with a certain EID (MAC address) in the local subnet to identify themselves.</td>
</tr>
</tbody>
</table>
### Table 6-2. Functions for the Automotive Diagnostic Command Set for C (Continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ndDoIPSendVehicleIdentReqVIN</code></td>
<td>Sends a UDP request to all DoIP-capable vehicles with a certain VIN (Vehicle Identification Number) in the local subnet to identify themselves.</td>
</tr>
<tr>
<td><code>ndDTCToString</code></td>
<td>Returns a string representation (such as <code>P1234</code>) for a 2-byte diagnostic trouble code (DTC).</td>
</tr>
<tr>
<td><code>ndECURest</code></td>
<td>Executes the ECURest service. Resets the ECU.</td>
</tr>
<tr>
<td><code>ndEnableNormalMessageTransmission</code></td>
<td>Executes the EnableNormalMessage Transmission service. The ECU starts transmitting its regular communication messages (usually CAN messages).</td>
</tr>
<tr>
<td><code>ndGetProperty</code></td>
<td>Get a diagnostic global internal parameter.</td>
</tr>
<tr>
<td><code>ndInputOutputControlByLocalIdentifier</code></td>
<td>Executes the InputOutputControlByLocalIdentifier service. Modifies the ECU I/O port behavior.</td>
</tr>
<tr>
<td><code>ndOBDClearEmissionRelatedDiagnosticInformation</code></td>
<td>Executes the OBD Clear Emission Related Diagnostic Information service. Clears emission-related diagnostic trouble codes (DTCs) in the ECU.</td>
</tr>
<tr>
<td><code>ndOBDOpen</code></td>
<td>Opens a diagnostic session on a CAN port for OBD-II.</td>
</tr>
<tr>
<td><code>ndOBDRequestControlOfOnBoardDevice</code></td>
<td>Executes the OBD Request Control Of On-Board Device service. Modifies ECU I/O port behavior.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Function</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ndOBDRequestCurrentPowertrainDiagnosticData</code></td>
<td>Executes the OBD Request Current Powertrain Diagnostic Data service. Reads an ECU data record.</td>
</tr>
<tr>
<td><code>ndOBDRequestEmissionRelatedDTCs</code></td>
<td>Executes the OBD Request Emission Related DTCs service. Reads all emission-related Diagnostic Trouble Codes (DTCs).</td>
</tr>
<tr>
<td><code>ndOBDRequestEmissionRelatedDTCsDuringCurrentDriveCycle</code></td>
<td>Executes the OBD Request Emission Related DTCs During Current Drive Cycle service. Reads the emission-related Diagnostic Trouble Codes (DTCs) that occurred during the current (or last completed) drive cycle.</td>
</tr>
<tr>
<td><code>ndOBDRequestOnBoardMonitoringTestResults</code></td>
<td>Executes the OBD Request On-Board Monitoring Test Results service. Reads an ECU test data record.</td>
</tr>
<tr>
<td><code>ndOBDRequestPermanentFaultCodes</code></td>
<td>Executes the OBD Request Permanent Fault Codes service. All permanent Diagnostic Trouble Codes (DTCs) are read.</td>
</tr>
<tr>
<td><code>ndOBDRequestPowertrainFreezeFrameData</code></td>
<td>Executes the OBD Request Powertrain Freeze Frame Data service. Reads an ECU data record stored while a diagnostic trouble code occurred.</td>
</tr>
<tr>
<td><code>ndOBDRequestVehicleInformation</code></td>
<td>Executes the OBD Request Vehicle Information service. Reads a set of information data from the ECU.</td>
</tr>
<tr>
<td><code>ndOpenDiagnostic</code></td>
<td>Opens a diagnostic session on a CAN port. Communication to the ECU is not yet started.</td>
</tr>
</tbody>
</table>
Table 6-2. Functions for the Automotive Diagnostic Command Set for C (Continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ndOpenDiagnosticOnIP</td>
<td>Opens a diagnostic session on an IP port. Communication to the ECU is not yet started.</td>
</tr>
<tr>
<td>ndReadDataByLocalIdentifier</td>
<td>Executes the ReadDataByLocal Identifier service. Reads an ECU data record.</td>
</tr>
<tr>
<td>ndReadDTCByStatus</td>
<td>Executes the ReadDiagnosticTroubleCodesByStatus service. Reads selected Diagnostic Trouble Codes (DTCs).</td>
</tr>
<tr>
<td>ndReadECUIdentification</td>
<td>Executes the ReadECUIdentification service. Returns ECU identification data from the ECU.</td>
</tr>
<tr>
<td>ndReadMemoryByAddress</td>
<td>Executes the ReadMemoryByAddress service. Reads data from the ECU memory.</td>
</tr>
<tr>
<td>ndReadStatusOfDTC</td>
<td>Executes the ReadStatusOfDiagnostic TroubleCodes service. Reads selected Diagnostic Trouble Codes (DTCs).</td>
</tr>
<tr>
<td>ndRequestRoutineResultsByLocalIdentifier</td>
<td>Executes the RequestRoutineResultsByLocalIdentifier service. Returns results from an ECU routine.</td>
</tr>
<tr>
<td>ndRequestSeed</td>
<td>Executes the SecurityAccess service to retrieve a seed from the ECU.</td>
</tr>
<tr>
<td>ndSendKey</td>
<td>Executes the SecurityAccess service to send a key to the ECU.</td>
</tr>
<tr>
<td>ndSetProperty</td>
<td>Set a diagnostic global internal parameter.</td>
</tr>
</tbody>
</table>
Table 6-2. Functions for the Automotive Diagnostic Command Set for C (Continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ndStartDiagnosticSession</td>
<td>Executes the StartDiagnosticSession service. The ECU is set up in a specific diagnostic mode.</td>
</tr>
<tr>
<td>ndStartRoutineByLocalIdentifier</td>
<td>Executes the StartRoutineByLocal Identifier service. Executes a routine on the ECU.</td>
</tr>
<tr>
<td>ndStatusToString</td>
<td>Returns a description for an error code.</td>
</tr>
<tr>
<td>ndStopDiagnosticSession</td>
<td>Executes the StopDiagnosticSession service. Returns the ECU to normal mode.</td>
</tr>
<tr>
<td>ndStopRoutineByLocalIdentifier</td>
<td>Executes the StopRoutineByLocal Identifier service. Stops a routine on the ECU.</td>
</tr>
<tr>
<td>ndTesterPresent</td>
<td>Executes the TesterPresent service. Keeps the ECU in diagnostic mode.</td>
</tr>
<tr>
<td>ndUDS06ReadMemoryByAddress</td>
<td>Executes the UDS ReadMemoryByAddress service. Reads data from the ECU memory.</td>
</tr>
<tr>
<td>ndUDS06WriteMemoryByAddress</td>
<td>Executes the UDS WriteMemoryByAddress service. Writes data to the ECU memory.</td>
</tr>
<tr>
<td>ndUDSClearDiagnosticInformation</td>
<td>Executes the UDS ClearDiagnosticInformation service. Clears selected Diagnostic Trouble Codes (DTCs).</td>
</tr>
</tbody>
</table>
### Table 6-2. Functions for the Automotive Diagnostic Command Set for C (Continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ndUDSCommunicationControl</td>
<td>Executes the UDS CommunicationControl service. Switches transmission and/or reception of the normal communication messages (usually CAN messages) on or off.</td>
</tr>
<tr>
<td>ndUDSControlDTCSetting</td>
<td>Executes the UDS ControlDTCSetting service. Modifies Diagnostic Trouble Code (DTC) behavior.</td>
</tr>
<tr>
<td>ndUDSDiagnosticSessionControl</td>
<td>Executes the UDS DiagnosticSessionControl service. The ECU is set up in a specific diagnostic mode.</td>
</tr>
<tr>
<td>ndUDSECURest</td>
<td>Executes the UDS ECUReset service. Resets the ECU.</td>
</tr>
<tr>
<td>ndUDSInputOutputControlByIdentifier</td>
<td>Executes the UDS InputOutputControlByIdentifier service. Modifies ECU I/O port behavior.</td>
</tr>
<tr>
<td>ndUDSReadDataByIdentifier</td>
<td>Executes the UDS ReadDataByIdentifier service. Reads an ECU data record.</td>
</tr>
<tr>
<td>ndUDSReadMemoryByAddress</td>
<td>Executes the UDS ReadMemoryByAddress service. Reads data from the ECU memory.</td>
</tr>
<tr>
<td>ndUDSReportDTCBySeverityMaskRecord</td>
<td>Executes the ReportDTCBySeverity MaskRecord subfunction of the UDS ReadDiagnosticTrouble CodeInformation service. Reads selected Diagnostic Trouble Codes (DTCs).</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>ndWriteMemoryByAddress</td>
<td>Executes the WriteMemoryByAddress service. Writes data to the ECU memory.</td>
</tr>
</tbody>
</table>
General Functions

ndCloseDiagnostic

Purpose
Closes a diagnostic session.

Format
long ndCloseDiagnostic(
   TD1 *diagRefIn);

Input
diagRefIn
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

Output
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description
The diagnostic session diagRefIn specifies is closed, and you can no longer use it for communication to an ECU. This command does not communicate the closing to the ECU before terminating; if this is necessary, you must manually do so (for example, by calling ndStopDiagnosticSession) before calling ndCloseDiagnostic.
**ndConvertFromPhys**

**Purpose**
Converts a physical data value into a binary representation using a type descriptor.

**Format**
```c
void ndConvertFromPhys(
    TD2 *typeDescriptor,
    double value,
    unsigned char dataOut[],
    long *len);
```

**Input**
typeDescriptor
A struct that specifies the conversion of the physical value to its binary representation:
```c
typedef struct {
    long StartByte;
    long ByteLength;
    unsigned short ByteOrder;
    unsigned short DataType;
    double ScaleFactor;
    double ScaleOffset;
} TD2;
```

StartByte is ignored by ndConvertFromPhys.

ByteLength is the number of bytes in the binary representation.

ByteOrder defines the byte order for multibyte representations. The values are:
- 0: MSB_FIRST (Motorola)
- 1: LSB_FIRST (Intel)

DataType is the binary representation format:
- 0: Unsigned. Only byte lengths of 1–4 are allowed.
- 1: Signed. Only byte lengths of 1–4 are allowed.
- 2: Float. Only byte lengths 4 or 8 are allowed.

ScaleFactor defines the physical value scaling:
- \( \text{Phys} = (\text{ScaleFactor}) \times (\text{binary representation}) + (\text{ScaleOffset}) \)

ScaleOffset (refer to ScaleFactor)

value
The physical value to be converted to a binary representation.
**Output**

`dataOut`

Points to the byte array to be filled with the binary representation of `value`.

`len`

On input, `len` must contain the `dataOut` array length. On return, it contains the number of valid data bytes in the `dataOut` array.

**Description**

Data input to diagnostic services (for example, `ndWriteDataByLocalIdentifier`) is usually a byte array of binary data. If you have the data input description (for example, `byte 3 and 4 are engine RPM scaled as .25 * × RPM in Motorola representation`), you can use `ndConvertFromPhys` to convert the physical value to the byte stream by filling an appropriate `typeDescriptor` struct.

`ndConvertFromPhys` converts only the portion specified by one type descriptor to a binary representation. If your data input consists of several values, you can use `ndConvertFromPhys` multiple times on different parts of the byte array.
**ndConvertToPhys**

**Purpose**
Converts a binary representation of a value into its physical value using a type descriptor.

**Format**
```c
void ndConvertToPhys(
    TD2 *typeDescriptor,
    unsigned char dataIn[],
    long len,
    double *value);
```

**Input**
- **typeDescriptor**
  A struct that specifies the conversion of the physical value to its binary representation:

```c
typedef struct {
    long StartByte;
    long ByteLength;
    unsigned short ByteOrder;
    unsigned short DataType;
    double ScaleFactor;
    double ScaleOffset;
} TD2;
```

- **StartByte** gives the start byte of the binary representation in the dataIn record.
- **ByteLength** is the number of bytes in the binary representation.
- **ByteOrder** defines the byte order for multibyte representations. The values are:
  0: MSB_FIRST (Motorola)
  1: LSB_FIRST (Intel)
- **DataType** is the binary representation format:
  0: Unsigned. Only byte lengths of 1–4 are allowed.
  1: Signed. Only byte lengths of 1–4 are allowed.
  2: Float. Only byte lengths 4 or 8 are allowed.
- **ScaleFactor** defines the physical value scaling:
  \[ \text{Phys} = (\text{ScaleFactor}) \times (\text{binary representation}) + (\text{ScaleOffset}) \]
- **ScaleOffset** (refer to ScaleFactor)
dataIn
Points to the byte array that contains the binary representation of value.

len
Must contain the dataIn array length.

Output
value
The physical value converted from the binary representation.

Description
Data output from diagnostic services (for example, \texttt{ndReadDataByLocalIdentifier}) is usually a byte stream of binary data. If you have a description of the data output (for example, \textit{byte 3 and 4 are engine RPM scaled as} \(0.25 \times \text{RPM in Motorola representation}\), you can use \texttt{ndConvertToPhys} to extract the physical value from the byte stream by filling an appropriate \texttt{typeDescriptor} struct.
ndCreateExtendedCANIds

Purpose

Creates diagnostic CAN identifiers according to ISO 15765-2.

Format

```c
void ndCreateExtendedCANIds (
    unsigned short addressingMode,
    unsigned short transportProtocol,
    unsigned char sourceAddress,
    unsigned char targetAddress,
    unsigned long *transmitID,
    unsigned long *receiveID);
```

Input

addressingMode

Specifies whether the ECU is physically or functionally addressed:

- 0: physical addressing
- 1: functional addressing

transportProtocol

Specifies whether normal or mixed mode addressing is used. The following values are valid:

- 0 ISO TP—Normal Mode. The ISO TP as specified in ISO 15765-2 is used; all eight data bytes of the CAN messages are used for data transfer.
- 1 ISO TP—Mixed Mode. The ISO TP as specified in ISO 15765-2 is used; the first data byte is used as address extension.

sourceAddress

The host (diagnostic tester) logical address.

targetAddress

The ECU logical address.
Chapter 6  Automotive Diagnostic Command Set API for C

Output

- **transmitID**
  The generated CAN identifier for sending diagnostic request messages from the host to the ECU.

- **receiveID**
  The generated CAN identifier for sending diagnostic response messages from the ECU to the host.

Description

ISO 15765-2 specifies a method for creating (extended/29 bit) CAN identifiers for diagnostic applications given the addressing mode (physical/functional), the transport protocol (normal/mixed), and the 8-bit source and target addresses. This function implements the construction of these CAN identifiers. You can use them directly in the `ndOpenDiagnostic` function.
**ndDiagFrameRecv**

**Purpose**
Receives a raw CAN frame on the diagnostic CAN ID to check for errors in the transport protocol implementation of an ECU.

**Format**
```c
long ndDiagFrameRecv(
    TD1 *diagRef,
    unsigned long timeout,
    unsigned char dataOut[],
    long *len);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.
- **timeout**
  Specifies the time to wait for the arrival of a message. If no message arrives within this time, a timeout error is returned.

**Output**
- **dataOut**
  Returns up to 8 bytes of payload data from a CAN frame received on the diagnostic identifier.
- **len**
  On input, `len` must contain the number of bytes provided for the `dataOut` buffer. On output, it returns the number of valid data bytes in `dataOut`.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Description

`ndDiagFrameRecv` receives an arbitrary raw CAN frame on the diagnostic CAN identifier. For example, you can check the transport protocol implementation of an ECU for correct responses if erroneous protocol requests are issued.
**ndDiagFrameSend**

**Purpose**
Sends a raw CAN frame on the diagnostic CAN ID to check for errors in the transport protocol implementation of an ECU.

**Format**
```
long ndDiagFrameSend(
    TD1 *diagRef,
    unsigned char dataIn[],
    long len);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.
- **dataIn**
  An array of up to 8 bytes sent as a CAN payload on the diagnostic identifier.
- **len**
  Must contain the number of (valid) data bytes in `dataIn`.

**Output**

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**
`ndDiagFrameSend` transmits an arbitrary raw CAN frame on the diagnostic CAN identifier. For example, you can check the transport protocol implementation of an ECU for robustness if erroneous protocol requests are issued.
ndDiagnosticService

Purpose
Executes a generic diagnostic service. If a special service is not available through the KWP2000, UDS, or OBD service functions, you can build it using this function.

Format
long ndDiagnosticService(
   TD1 *diagRef,
   LVBoolean *requireResponse,
   unsigned char dataIn[],
   long len,
   unsigned char dataOut[],
   long *len2);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

requireResponse
Indicates whether a response to this service is required. If *requireResponse is FALSE, dataOut returns no values, and len2 returns 0. This parameter is passed by reference.

dataIn
Contains the request message byte sequence for the diagnostic service sent to the ECU.

len
Must contain the number of valid data bytes in dataIn.

Output
dataOut
Contains the response message byte sequence of the diagnostic service returned from the ECU.

len2
On input, len2 must contain the number of bytes provided for the dataOut buffer. On output, it returns the number of valid data bytes in dataOut.
Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description

`ndDiagnosticService` is a generic routine to execute any diagnostic service. The request and response messages are fed unmodified to the `dataIn` input and retrieved from the `dataOut` output, respectively. No interpretation of the contents is done, with one exception: The error number is retrieved from a negative response, if one occurs. In this case, an error is communicated through the return value.

All specialized diagnostic services call `ndDiagnosticService` internally.
ndDTCToString

Purpose

Returns a string representation (such as P1234) for a 2-byte diagnostic trouble code (DTC).

Format

void ndDTCToString(
    unsigned long DTCNum,
    char DTCString[],
    long *len);

Input

DTCNum

The DTC number as returned in the DTCs structs of ndReadDTCByStatus, ndReadStatusOfDTC, ndUDSReportDTCBySeverityMaskRecord, ndUDSReportDTCByStatusMask, ndUDSReportSeverityInformationOfDTC, ndUDSReportSupportedDTCs, ndOBDRequestEmissionRelatedDTCs, or ndOBDRequestEmissionRelatedDTCsDuringCurrentDriveCycle.

Note  This function converts only 2-byte DTCs. If you feed in larger numbers, the function returns garbage.

Output

DTCString

The DTC string representation.

len

On input, len must contain the DTCString array length (at least 6). On return, it contains the number of valid data bytes in the DTCString array.

Description

The SAE J2012 standard specifies a naming scheme for 2-byte DTCs consisting of one letter and four digits. Use ndDTCToString to convert the DTC numerical representation to this name.
ndGetProperty

Purpose

Gets a diagnostic global internal parameter.

Format

```c
void ndGetProperty(
    unsigned short propertyID,
    unsigned long *propertyValue);
```

Input

propertyID

Defines the parameter whose value is to be retrieved:

0  **Timeout Diag Command** is the timeout in milliseconds the master waits for the response to a diagnostic request message. The default is 1000 ms.

1  **Timeout FC (Bs)** is the timeout in milliseconds the master waits for a Flow Control frame after sending a First Frame or the last Consecutive Frame of a block. The default is 250 ms.

2  **Timeout CF (Cr)** is the timeout in milliseconds the master waits for a Consecutive Frame in a multiframe response. The default is 250 ms.

3  **Receive Block Size (BS)** is the number of Consecutive Frames the slave sends in one block before waiting for the next Flow Control frame. A value of 0 (default) means all Consecutive Frames are sent in one run without interruption.

4  **Wait Time CF (STmin)** defines the minimum time for the slave to wait between sending two Consecutive Frames of a block. Values from 0 to 127 are wait times in milliseconds. Values 241 to 249 (Hex F1 to F9) mean wait times of 100 μs to 900 μs, respectively. All other values are reserved. The default is 5 ms.

5  **Max Wait Frames (N_WFTmax)** is the maximum number of WAIT frames the master accepts before terminating the connection. The default is 10.

6  **Wait Frames to Send (N_WAIT)** is the number of WAIT frames the master sends every time before a CTS frame is sent. If you set this value to a negative number (for example, 0xFFFFFFFF = –1), the master sends an OVERLOAD frame instead of a WAIT, and reception is aborted. The default is 0 for maximum speed.

7  **Time between Waits (T_W)** is the number of milliseconds the master waits after sending a WAIT frame. The default is 25.
8 **Fill CAN Frames** returns whether a CAN frame is transmitted with 8 bytes or less.

- 0: Short CAN frames are sent with DLC < 8.
- 1: Short CAN frames are filled to 8 bytes with Fill Byte (default).

9 **Fill Byte** returns the CAN frame content if filled with defined data or random data bytes.

- 0–255: Byte is used optionally to fill short CAN frames.
- 256: Short CAN frames are filled optionally with random bytes.
  The default is 255 (0xFF).

10 **Invalid Response as Error** returns how the toolkit handles an invalid ECU response.

- 0: Invalid response is indicated by success = FALSE only (default).
- 1: Invalid response is returned as an error in addition.

11 **Max RspPending Count** is the number of times a ReqCorrectlyRcvd-RspPending (0x78) Negative Response Message will be accepted to extend the command timeout (default 5). If this message is sent more often in response to a request, an error −8120 is returned. If the ECU implements commands with a long duration (for example, flash commands), you may need to extend this number.

12 **VWTP Command Time Out** is the time in milliseconds the host waits for a VWTP 2.0 command to be executed (default 50 ms). The specification states this as 50 ms plus the network latency, but some ECUs may require higher values.

**Output**

```
propertyValue
```

The requested property value.

**Description**

Use this function to request several internal diagnostic parameters, such as timeouts for the transport protocol. Use `ndSetProperty` to modify the parameters.
ndOBDOpen

Purpose
Opens a diagnostic session on a CAN port for OBD-II.

Format
long ndOBDOpen (  
    char CANInterface[],  
    unsigned long baudrate,  
    unsigned long transmitID,  
    unsigned long receiveID,  
    TD1 *diagRefOut);  

Input
CANInterface
Specifies the CAN interface on which the diagnostic communication should take place.

NI-CAN
The CAN interface is the name of the NI-CAN Network Interface Object to configure. This name uses the syntax CANx, where x is a decimal number starting at 0 that indicates the CAN network interface (CAN0, CAN1, up to CAN63). CAN network interface names are associated with physical CAN ports using Measurement and Automation Explorer (MAX).

NI-XNET
By default, the Automotive Diagnostic Command Set uses NI-CAN for CAN communication. This means you must define an NI-CAN interface for your NI-XNET hardware (NI-CAN compatibility mode) to use your XNET hardware for CAN communication. However, to use your NI-XNET interface in the native NI-XNET mode (meaning it does not use the NI-XNET Compatibility Layer), you must define your interface under NI-XNET Devices in MAX and pass the NI-XNET interface name that the Automotive Diagnostic Command Set will use. To do this, add @ni_genie_nixnet to the protocol string (for example, CAN1@ni_genie_nixnet). The interface name is related to the NI-XNET hardware naming under Devices and Interfaces in MAX.

CompactRIO or R Series
If using CompactRIO or R Series hardware, you must provide a bitfile that handles the CAN communication between the host system and FPGA. To access the CAN module on the FPGA, you must specify the bitfile name after the @ (for example, CAN1@MyBitfile.lvbitx). To specify a special RIO target, you can specify that target by its name followed by the bitfile name (for example, CAN1@RIO1,MyBitfile.lvbitx). Currently, only a single CAN interface is supported. RIO1 defines the RIO target name as defined in your LabVIEW Project definition. The lvbitx filename represents the
filename and location of the bitfile on the host if using RIO or on a CompactRIO target. This implies that you must download the bitfile to the CompactRIO target before you can run your application. You may specify an absolute path or a path relative to the root of your target for the bitfile.

**baudrate**

The diagnostic communication baud rate.

**transmitID**

The CAN identifier for sending diagnostic request messages from the host to the ECU. Set to –1 (0xFFFFFFFF) for the default OBD CAN identifier.

**receiveID**

The CAN identifier for sending diagnostic response messages from the ECU to the host. Set to –1 (0xFFFFFFFF) for the default OBD CAN identifier.

**Output**

**diagRefOut**

A struct containing all necessary information about the diagnostic session. This is passed as a handle to all subsequent diagnostic functions, and you must close it using `ndCloseDiagnostic`.

**Return Value**

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**

`ndOBDOpen` opens a diagnostic communication channel to an ECU for OBD-II. The CAN port specified as input is initialized, and a handle to it is stored (among other internal data) into the `diagRefOut` struct, which serves as reference for further diagnostic functions.

If the `transmitID` and `receiveID` parameters are set to –1, communication is first tried on the default 11-bit OBD CAN identifiers; if that fails, the default 29-bit OBD CAN identifiers are tried. If that also fails, an error is returned.

If valid `transmitID` or `receiveID` parameters (11-bit or 29-bit with bit 29 set) are given, communication is tried on these identifiers. If that fails, an error is returned.

In general, it is not necessary to manipulate the `diagRefOut` struct contents.
Possible examples of selections for the interface parameter for the various hardware targets are as follows.

Using NI-CAN hardware:
- **CAN0**—uses CAN interface 0.
- **CAN1**—uses CAN interface 1 and so on with the form CANx.
- **CAN256**—uses virtual NI-CAN interface 256.

Using NI-XNET hardware:
- **CAN1@ni_genie_nixnet**—uses CAN interface 1 of an NI-XNET device.
- **CAN2@ni_genie_nixnet**—uses CAN interface 2 of an NI-XNET device and so on with the form CANx.

Using R Series:
- **CAN1@RIO1,c:\temp\MyFpgaBitfile.lvbitx**—uses a named target RIO1 as compiled into the bitfile at location c:\temp\MyFpgaBitfile.lvbitx.

Using CompactRIO:
- **CAN1@\\MyFpgaBitfile.lvbitx**—uses compiled bitfile MyFpgaBitfile.lvbitx, which must be FTP copied to the root of the CompactRIO target.
ndOpenDiagnostic

Purpose
Opens a diagnostic session on a CAN port. Communication to the ECU is not yet started.

Format
long ndOpenDiagnostic(
    char CANInterface[],
    unsigned long baudrate,
    unsigned short transportProtocol,
    unsigned long transmitID,
    unsigned long receiveID,
    TD1 *diagRefOut);

Input
CANInterface
Specifies the CAN interface on which the diagnostic communication should take place.

NI-CAN
The CAN interface is the name of the NI-CAN Network Interface Object to configure. This name uses the syntax CANx, where x is a decimal number starting at 0 that indicates the CAN network interface (CAN0, CAN1, up to CAN63). CAN network interface names are associated with physical CAN ports using Measurement and Automation Explorer (MAX).

NI-XNET
By default, the Automotive Diagnostic Command Set uses NI-CAN for CAN communication. This means you must define an NI-CAN interface for your NI-XNET hardware (NI-CAN compatibility mode) to use your XNET hardware for CAN communication. However, to use your NI-XNET interface in the native NI-XNET mode (meaning it does not use the NI-XNET Compatibility Layer), you must define your interface under **NI-XNET Devices** in MAX and pass the NI-XNET interface name that the Automotive Diagnostic Command Set will use. To do this, add @ni_genie_nixnet to the Protocol string (for example, CAN1@ni_genie_nixnet). The interface name is related to the NI-XNET hardware naming under **Devices and Interfaces** in MAX.

CompactRIO or R Series
If using CompactRIO or R Series hardware, you must provide a bitfile that handles the CAN communication between the host system and FPGA. To access the CAN module on the FPGA, you must specify the bitfile name after the @ (for example, CAN1@MyBitfile.lvbitx). To specify a special RIO target, you can specify that target by its name followed by the bitfile name (for example, CAN1@RIO1,MyBitfile.lvbitx). Currently, only a single CAN interface is supported. RIO1 defines the RIO target name.
as defined in your LabVIEW Project definition. The \textit{lvbitx} filename represents the filename and location of the bitfile on the host if using RIO or on a CompactRIO target. This implies that you must download the bitfile to the CompactRIO target before you can run your application. You may specify an absolute path or a path relative to the root of your target for the bitfile.

\begin{itemize}
  \item \textbf{baudrate}
  \begin{itemize}
    \item The diagnostic communication baud rate.
  \end{itemize}
  \item \textbf{transportProtocol}
  \begin{itemize}
    \item Specifies the transport protocol for transferring the diagnostic service messages over the CAN network. The following values are valid:
    \begin{itemize}
      \item 0 \textbf{ISO TP—Normal Mode}. The ISO TP as specified in ISO 15765-2 is used; all eight data bytes of the CAN messages are used for data transfer.
      \item 1 \textbf{ISO TP—Mixed Mode}. The ISO TP as specified in ISO 15765-2 is used; the first data byte is used as address extension.
      \item 2 \textbf{VW TP 2.0}.
    \end{itemize}
  \end{itemize}
  \item \textbf{transmitID}
  \begin{itemize}
    \item The CAN identifier for sending diagnostic request messages from the host to the ECU.
  \end{itemize}
  \item \textbf{receiveID}
  \begin{itemize}
    \item The CAN identifier for sending diagnostic response messages from the ECU to the host.
  \end{itemize}
\end{itemize}

\textbf{Output}
\begin{itemize}
  \item \textbf{diagRefOut}
  \begin{itemize}
    \item A struct containing all necessary information about the diagnostic session. This is passed as a handle to all subsequent diagnostic functions, and you must close it using \texttt{ndCloseDiagnostic}.
  \end{itemize}
\end{itemize}

\textbf{Return Value}
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the \texttt{ndStatusToString} function to obtain a descriptive string for the return value.
Description

`ndOpenDiagnostic` opens a diagnostic communication channel to an ECU. This function initializes the CAN port specified as input and stores a handle to it (among other internal data) into `diagRefOut`, which serves as reference for further diagnostic functions.

No communication to the ECU takes place at this point. To open a diagnostic session on the ECU, call `ndStartDiagnosticSession` or `ndUDSDiagnosticSessionControl`.

In general, you do not need to manipulate the `diagRefOut` struct contents, except if you use the **ISO TP—Mixed Mode** transport protocol, in which case you must store the address extensions for transmit and receive in the appropriate members of that struct.

Possible examples of selections for the interface parameter for the various hardware targets are as follows.

Using NI-CAN hardware:
- **CAN0**—uses CAN interface 0.
- **CAN1**—uses CAN interface 1 and so on with the form CANx.
- **CAN256**—uses virtual NI-CAN interface 256.

Using NI-XNET hardware:
- **CAN1@ni_genie_nixnet**—uses CAN interface 1 of an NI-XNET device.
- **CAN2@ni_genie_nixnet**—uses CAN interface 2 of an NI-XNET device and so on with the form CANx.

Using R Series:
- **CAN1@RIO1,c:\temp\MyFpgaBitfile.lvbitx**—uses a named target RIO1 as compiled into the bitfile at location `c:\temp\MyFpgaBitfile.lvbitx`.

Using CompactRIO
- **CAN1@MyFpgaBitfile.lvbitx**—uses compiled bitfile `MyFpgaBitfile.lvbitx`, which must be FTP copied to the root of the CompactRIO target.
**ndOpenDiagnosticOnIP**

**Purpose**
Opens a diagnostic session on an IP port. Communication to the ECU is not yet started.

**Format**
```c
long ndOpenDiagnosticOnIP(
    LVBoolean *dynamicPort,
    TD1 *diagRefOut);
```

**Input**
dynamicPort
Defines whether the standard UDP port 13401 (UDP_TEST_EQUIPMENT_LISTEN) is used for communication (FALSE) or a dynamically assigned UDP port (UDP_TEST_EQUIPMENT_REQUEST) is opened (TRUE).

**Output**
diagRefOut
A struct that contains all necessary information about the diagnostic session. Pass this struct as a handle to all subsequent diagnostic functions and close it using **ndCloseDiagnostic**.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the **ndStatusToString** function to obtain a descriptive string for the return value.
Description

ndOpenDiagnosticOnIP opens a Diagnostic on Internet Protocol (DoIP) communication channel to an ECU. The UDP port specified as input is initialized, and a handle to it is stored (among other internal data) in diagRefOut, which serves as reference for further diagnostic functions.

Note that no communication to an ECU takes place at this point. To open a diagnostic session on an ECU, call ndDoIPGetEntities to find out which DoIP entities (DoIP-capable ECUs) exist in the network. You need to create a TCP/IP connection to the selected DoIP entity using ndDoIPConnect. After that, you can execute diagnostic services on the TCP/IP connection.

This VI replaces the standard (CAN-based) ndOpenDiagnostic, because the CAN parameters are no longer relevant for IP-based diagnostics.

In general, it is not necessary to manipulate the diagRefOut cluster contents.
**ndSetProperty**

**Purpose**
Sets a diagnostic global internal parameter.

**Format**
```c
void ndSetProperty(
    unsigned short propertyID,
    unsigned long propertyValue);
```

**Input**

- `propertyID`
  Defines the parameter whose value is to be modified:
  
  0  **Timeout Diag Command** is the timeout in milliseconds the master waits for the response to a diagnostic request message. The default is 1000 ms.
  
  1  **Timeout FC (Bs)** is the timeout in milliseconds the master waits for a Flow Control frame after sending a First Frame or the last Consecutive Frame of a block. The default is 250 ms.
  
  2  **Timeout CF (Cr)** is the timeout in milliseconds the master waits for a Consecutive Frame in a multiframe response. The default is 250 ms.
  
  3  **Receive Block Size (BS)** is the number of Consecutive Frames the slave sends in one block before waiting for the next Flow Control frame. A value of 0 (default) means all Consecutive Frames are sent in one run without interruption.
  
  4  **Wait Time CF (STmin)** defines the minimum time for the slave to wait between sending two Consecutive Frames of a block. Values from 0 to 127 are wait times in milliseconds. Values 241 to 249 (Hex F1 to F9) mean wait times of 100 \(\mu\)s to 900 \(\mu\)s, respectively. All other values are reserved. The default is 5 ms.
  
  5  **Max Wait Frames (N_WFTmax)** is the maximum number of WAIT frames the master accepts before terminating the connection. The default is 10.
  
  6  **Wait Frames to Send (N_WAIT)** is the number of WAIT frames the master sends every time before a CTS frame is sent. If you set this value to a negative number (for example, 0xFFFFFFFF = -1), the master sends an OVERLOAD frame instead of a WAIT, and reception is aborted. The default is 0 for maximum speed.
  
  7  **Time between Waits (T_W)** is the number of milliseconds the master waits after sending a WAIT frame. The default is 25.
8 **Fill CAN Frames** specifies whether a CAN frame is transmitted with 8 bytes or less.
0: Short CAN frames are sent with DLC < 8.
1: Short CAN frames are filled to 8 bytes with **Fill Byte** (default).

9 **Fill Byte** specifies the CAN frame content, filled with defined data or random data.
0–255: Byte is used optionally to fill short CAN frames.
256: Short CAN frames are filled optionally with random bytes.
The default is 255 (0xFF).

10 **Invalid Response as Error** specifies how the toolkit handles an invalid ECU response.
0: Invalid response is indicated by `success = FALSE` only (default).
1: Invalid response is returned as an error in addition.

11 **Max RspPending Count** defines the number of times a 
ReqCorrectlyRcvd-RspPending (0x78) Negative Response Message will be accepted to extend the command timeout (default 5). If this message is sent more often in response to a request, an error –8120 is returned. If the ECU implements commands with a long duration (for example, flash commands), you may need to extend this number.

12 **VWTP Command Time Out** is the time in milliseconds the host waits for a 
VWTP 2.0 command to be executed (default 50 ms). The specification states this as 50 ms plus the network latency, but some ECUs may require higher values.

```c
propertyName
  The requested property value.

Output
  None.

Description
  Use this function to set several internal diagnostic parameters, such as timeouts for the transport protocol. Use `ndGetProperty` to read them out.
**ndStatusToString**

**Purpose**

Returns a description for an error code.

**Format**

```c
void ndStatusToString(
    long errorCode,
    char message[],
    long *len);
```

**Input**

`errorCode`

The status code (return value) of any other diagnostic functions.

**Output**

`message`

Returns a descriptive string for the error code.

`len`

On input, `len` must contain the `message` array length. On return, it contains the number of valid data bytes in the `message` array.

**Description**

When the status code returned from an Automotive Diagnostic Command Set function is nonzero, an error or warning is indicated. This function obtains an error/warning description for debugging purposes.

The return code is passed into the `errorCode` parameter. The `len` parameter indicates the number of bytes available in the string for the description. The description is truncated to size `len` if needed, but a size of 1024 characters is large enough to hold any description. The text returned in `message` is null-terminated, so you can use it with ANSI C functions such as `printf`. For C or C++ applications, each Automotive Diagnostic Command Set function returns a status code as a signed 32-bit integer. The following table summarizes the Automotive Diagnostic Command Set use of this status.
Status Code Use

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Negative</td>
<td>Error—Function did not perform the expected behavior.</td>
</tr>
<tr>
<td>Positive</td>
<td>Warning—Function performed as expected, but a condition arose that may require attention.</td>
</tr>
<tr>
<td>Zero</td>
<td>Success—Function completed successfully.</td>
</tr>
</tbody>
</table>

The application code should check the status returned from every Automotive Diagnostic Command Set function. If an error is detected, close all Automotive Diagnostic Command Set handles and exit the application. If a warning is detected, you can display a message for debugging purposes or simply ignore the warning.

The following code shows an example of handling Automotive Diagnostic Command Set status during application debugging.

```c
Status = ndOpenDiagnostic ("CAN0", 500000, 0, 0x7E0, 0x7E8, &MyDiagHandle);
PrintStat (status, "ndOpenDiagnostic");
```

where the function `PrintStat` has been defined at the top of the program as:

```c
void PrintStat(mcTypeStatus status, char *source)
{
    char statusString[1024];
    long len = sizeof(statusString);
    if (status != 0)
    {
        ndStatusToString(status, statusString, &len);
        printf("\n\n%s\nSource = %s\n", statusString, source);
        if (status < 0)
        {
            ndCloseDiagnostic(&MyDiagHandle);
            exit(1);
        }
    }
}
```
ndVWTPConnect

Purpose
Establishes a connection channel to an ECU using the VW TP 2.0.

Format

long ndVWTPConnect(
    TD1 *diagRef,
    unsigned long channelID,
    unsigned char applicationType);

Input

diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

channelID
Defines the CAN identifier on which the ECU responds for this connection. The ECU defines the ID on which the host transmits.

applicationType
Specifies the communication type that takes place on the communication channel. For diagnostic applications, specify KWP2000 (1). The other values are for manufacturer-specific purposes.

Output

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
Description

For the VW TP 2.0, you must establish a connection to the ECU before any diagnostic communication can occur. This function sets up a unique communication channel to an ECU that you can use in subsequent diagnostic service requests.

You must maintain the communication link thus created by periodically (at least once a second) calling `ndVWTPConnectionTest`.

No equivalent exists for the ISO TP (ISO 15765-2), as the ISO TP does not use a special communication link.
ndVWTPConnectionTest

Purpose
Maintains a connection channel to an ECU using the VW TP 2.0.

Format
long ndVWTPConnectionTest(
    TD1 *diagRef);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

Output
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description
For the VW TP 2.0, you must periodically maintain the connection link to the ECU, so that the ECU does not terminate it. You must execute this periodic refresh at least once per second.

This function sends a Connection Test message to the ECU and evaluates its response, performing the necessary steps to maintain the connection.

There is no equivalent for the ISO TP (ISO 15765-2), as the ISO TP does not use a special communication link.
ndVWTPDisconnect

Purpose
Terminates a connection channel to an ECU using the VW TP 2.0.

Format
long ndVWTPDisconnect(
    TDI *diagRef);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

Output

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description
For the VW TP 2.0, you must disconnect the ECU connection link to properly terminate communication to the ECU. This function sends the proper disconnect messages and unlinks the communication.

Use ndVWTPConnect to create a new connection to the same ECU.

There is no equivalent for the ISO TP (ISO 15765-2), as the ISO TP does not use a special communication link.
DoIP Functions

ndDoIPActivateRouting

**Purpose**

Defines the source and target address for a DoIP TCP/IP connection.

**Format**

```c
long ndDoIPActivateRouting (  
    TD1 *diagRef,  
    unsigned char ActivationType,  
    unsigned short SourceAddress,  
    unsigned short *TargetAddress);  
```

**Input**

- **diagRef**
  Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **ActivationType**
  Indicates the specific type of routing activation that may require different types of authentication and/or confirmation. Defined values are:
  - 0    Default.
  - 1    WWH-OBDD (worldwide harmonized onboard diagnostic).
  - 0xE0 Use OEM-specific central security approach.
  - Values 2 to 0xDF are reserved. Values 0xE0 to 0xFF are OEM specific.

- **SourceAddress**
  The DoIP source address of the tester that starts the communication.
Output

**TargetAddress**

The logical address of the responding DoIP entity.

**Return Value**

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**

`ndDoIPActivateRouting` establishes a route for the DoIP messages and assigns an endpoint `TargetAddress`. After successfully establishing a route, diagnostic messages can be exchanged with the target DoIP entity using any of the diagnostic service functions.
ndDoIPConnect

Purpose

Creates a TCP/IP connection to a DoIP entity identified by its IP address.

Format

```c
long ndDoIPConnect(
    TD1 *diagRef,
    char address[],
    unsigned short SourceAddress,
    unsigned short TargetAddress);
```

Input

diagRef

Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

address

The IP address of the DoIP entity to connect to (zero-terminated string in `a.b.c.d` notation).

SourceAddress

The DoIP source address of the tester that starts the communication. You can set this input to 0 if you are activating a route through `ndDoIPActivateRouting`.

TargetAddress

The DoIP target address of the device under test that should be connected to. You can set this input to 0 if you are activating a route through `ndDoIPActivateRouting`.

Output

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Description

ndDoIPConnect creates a unique TCP/IP data connection to a certain DoIP entity identified by its IP address. The IP address might be retrieved from ndDoIPGetEntities. The TCP/IP data connection is needed to exchange diagnostic service requests.

You can specify SourceAddress and TargetAddress at this point or leave them blank if a routing activation is executed later using ndDoIPActivateRouting.
**ndDoIPDisconnect**

**Purpose**
Disconnected the TCP/IP connection to a DoIP entity.

**Format**
```c
long ndDoIPDisconnect(
    TD1 *diagRef);
```

**Input**

diagRef

 Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

**Output**

**Return Value**

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**

`ndDoIPDisconnect` terminates the TCP/IP connection to the connected DoIP entity. After executing this VI, diagnostic services no longer can be executed on that DoIP entity. You can reconnect with `ndDoIPConnect`.
ndDoIPEntityStatus

Purpose

Gets status information from a DoIP entity.

Format

```c
long ndDoIPEntityStatus(
    TD1 *diagRef,
    unsigned char *nodeType,
    unsigned char *maxSockets,
    unsigned char *curSockets,
    LVBoolean *ok);
```

Input

diagRef

Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

Output

nodeType

Indicates the type of DoIP entity. Possible values are:

- 0  DoIP gateway
- 1  DoIP node

All other values are reserved.

maxSockets

Represents the maximum number of concurrent TCP/IP sockets allowed with this DoIP entity, excluding the reserve socket required for socket handling.

curSockets

The number of currently established TCP/IP sockets.

ok

Indicates successful receipt of a positive response message for this diagnostic service.
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description
`ndDoIPEntityStatus` serves the purpose of identifying certain operating conditions of the responding DoIP entity. For example, this allows for test equipment to detect existing diagnostic communication sessions as well as a DoIP entity’s capabilities.
**ndDoIPGetDiagPowerMode**

**Purpose**

Gets information on the DoIP entity power state.

**Format**

```c
long ndDoIPGetDiagPowerMode(
    TD1 *diagRef,
    unsigned char *powerMode,
    LVBoolean *ok);
```

**Input**

- **diagRef**
  
  Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

**Output**

- **powerMode**
  
  Identifies whether the vehicle is in Diagnostic Power Mode and ready to perform reliable diagnostics. Possible values are:
  
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Not ready</td>
</tr>
<tr>
<td>1</td>
<td>Ready</td>
</tr>
</tbody>
</table>
  
  All other values are reserved.

- **ok**
  
  Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**

`ndDoIPGetDiagPowerMode` retrieves a vehicle’s Diagnostic Power Mode. For example, test equipment can use this information to verify whether the vehicle is in Diagnostic Power Mode, which allows for performing reliable diagnostics on the vehicle’s components.
**ndDoIPGetEntities**

**Purpose**

Returns a table of all DoIP entities (vehicles) on the local subnet, possibly restricted to EID or VIN.

**Format**

```c
long ndDoIPGetEntities(
    TD1 *diagRef,
    unsigned short DoIPOpenType,
    char VINOrEID[],
    unsigned char *DoIPEntities,
    unsigned long *len);
```

**Input**

`diagRef`

Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

`DoIPOpenType`

Defines which DoIP entities this command queries and lists. Allowed values are:

- 0  VIN (VIN is specified in `VINOrEID`)
- 1  EID (EID is specified in `VINOrEID`)
- 2  All (VINOrEID is ignored)

Other values are reserved.

`VINOrEID`

Depends on `DoIPOpenType`:

<table>
<thead>
<tr>
<th><code>DoIPOpenType</code></th>
<th><code>VINOrEID</code> Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>A 17-character Vehicle Identification Number. Only DoIP entities for this VIN are listed.</td>
</tr>
<tr>
<td>1</td>
<td>An Entity ID (usually a MAC address). Only the DoIP entity with this ID is listed. Specify the EID as <code>xx-xx-xx-xx-xx-xx</code>, where each <code>x</code> stands for a hexadecimal digit.</td>
</tr>
<tr>
<td>2</td>
<td>Ignored.</td>
</tr>
</tbody>
</table>

© National Instruments Corporation 6-51 Automotive Diagnostic Command Set User Manual
Output

DoIPEntities

Returns an array of C structs, each of which describe a DoIP entity:

```c
typedef struct
{
    char               VIN[18];
    unsigned short   Address;
    unsigned char     EID[6];
    unsigned char     GID[6];
    char               IP_Address[16];
} DOIP_ENTITY;
```

- **VIN**: Contains the Vehicle Identification Number assigned to the DoIP entity. Could be empty if not assigned.
- **Address**: The logical (Target) DoIP Address of the DoIP Entity.
- **EID**: Contains the Entity ID (usually the Hardware MAC address) assigned to the DoIP entity. Could be empty (0) if not assigned.
- **GID**: Contains the Group ID assigned to the DoIP entity. Could be empty (0) if not assigned.
- **IP_Address**: Contains the DoIP Entity IP Address (in a.b.c.d notation).

**len**

Returns the size of the DoIPEntities array in bytes. Must be initialized with the size (in bytes) of the buffer provided for DoIPEntities.

**Return Value**

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**

`ndDoIPGetEntities` uses a UDP broadcast to identify all DoIP entities in the local subnet matching a certain condition. The entities responding are returned in the DoIPEntities cluster array.

The conditions are either a common VIN or EID or simply all entities connected. Refer to the description of `DoIPOpenType` and `VINorEID`.
**ndDoIPSendVehicleIdentRequest**

**Purpose**
Sends a UDP request to all DoIP-capable vehicles in the local subnet to identify themselves.

**Format**

```c
long ndDoIPSendVehicleIdentRequest(
    TD1 *diagRef);
```

**Input**

`diagRef`
Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

**Output**

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**

`ndDoIPSendVehicleIdentRequest` sends a Vehicle Identification Request to all DoIP entities in the local subnet.

Usually, this is done as part of `ndDoIPGetEntities` and does not need to be executed separately.
**ndDoIPSendVehicleIdentReqEID**

**Purpose**
Sends a UDP request to all DoIP-capable vehicles with a certain EID (MAC address) in the local subnet to identify themselves.

**Format**

```c
long ndDoIPSendVehicleIdentReqEID(
    TD1 *diagRef,
    char EID[]);
```

**Input**

diagRef
Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

EID
The Entity ID (usually the MAC address) of the DoIP entity that is assumed to respond. Specify the EID as `xx-xx-xx-xx-xx-xx`, where each `x` stands for a hexadecimal digit (zero-terminated string).

**Output**

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**

`ndDoIPSendVehicleIdentReqEID` sends a Vehicle Identification Request to all DoIP entities in the local subnet identified by the given EID.

Usually, this is done as part of `ndDoIPGetEntities` and does not need to be executed separately.
**ndDoIPSendVehicleIdentReqVIN**

**Purpose**
Sends a UDP request to all DoIP-capable vehicles with a certain VIN (Vehicle Identification Number) in the local subnet to identify themselves.

**Format**
```c
long ndDoIPSendVehicleIdentReqVIN(
    TD1 *diagRef,
    char VIN[]);
```

**Input**
- **diagRef**
  Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **VIN**
  The 17-character Vehicle Identification Number of the DoIP entity that is assumed to respond (zero-terminated string).

**Output**

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**
`ndDoIPSendVehicleIdentReqVIN` sends a Vehicle Identification Request to all DoIP entities in the local subnet identified by the given VIN.

Usually, this is done as part of `ndDoIPGetEntities` and does not need to be executed separately.
KWP2000 Services

ndClearDiagnosticInformation

Purpose
Executes the ClearDiagnosticInformation service. Clears selected Diagnostic Trouble Codes (DTCs).

Format
long ndClearDiagnosticInformation(
    TD1 *diagRef,
    unsigned short groupOfDTC,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

groupOfDTC
Specifies the group of diagnostic trouble codes to be cleared. The following values have a special meaning:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0000</td>
<td>All powertrain DTCs</td>
</tr>
<tr>
<td>0x4000</td>
<td>All chassis DTCs</td>
</tr>
<tr>
<td>0x8000</td>
<td>All body DTCs</td>
</tr>
<tr>
<td>0xC000</td>
<td>All network related DTCs</td>
</tr>
<tr>
<td>0xFF00</td>
<td>All DTCs</td>
</tr>
</tbody>
</table>
Output

`success`

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description

This function clears the diagnostic information on the ECU memory. `groupOfDTC` specifies the type of diagnostic trouble codes to be cleared on the ECU memory.

For further details about this service, refer to the ISO 14230-3 standard.
ndControlDTCSetting

Purpose
Executes the ControlDTCSetting service. Modifies the generation behavior of selected Diagnostic Trouble Codes (DTCs).

Format
long ndControlDTCSetting(
    TD1 *diagRef,
    unsigned short groupOfDTC,
    unsigned char dataIn[],
    long len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

groupOfDTC
Specifies the group of diagnostic trouble codes to be cleared. The following values have a special meaning:
0x0000 All powertrain DTCs
0x4000 All chassis DTCs
0x8000 All body DTCs
0xC000 All network related DTCs
0xFF00 All DTCs
dataIn
Specifies application-specific data that control DTC generation.
len
Must contain the number of valid data bytes in dataIn.
Output

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
**ndDisableNormalMessageTransmission**

**Purpose**
Executes the DisableNormalMessageTransmission service. The ECU no longer transmits its regular communication messages (usually CAN messages).

**Format**
```c
long ndDisableNormalMessageTransmission(
    TD1 *diagRef,
    LVBoolean *requireResponse,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **requireResponse**
  Indicates whether a response to this service is required. If `*requireResponse` is `FALSE`, no response is evaluated, and `success` is always returned `TRUE`. This parameter is passed by reference.

**Output**
- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
ndECUReset

Purpose
Executes the ECUReset service. Resets the ECU.

Format

```c
long ndECUReset(
    TD1 *diagRef,
    unsigned char mode,
    LVBoolean *success);
```

Input
diagRef
Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

mode
Indicates the reset mode:

<table>
<thead>
<tr>
<th>Hex</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td><strong>PowerOn</strong></td>
</tr>
<tr>
<td></td>
<td>This value identifies the PowerOn ResetMode, a simulated PowerOn reset that most ECUs perform after the ignition OFF/ON cycle. When the ECU performs the reset, the client (tester) re-establishes communication.</td>
</tr>
<tr>
<td>02</td>
<td><strong>PowerOnWhileMaintainingCommunication</strong></td>
</tr>
<tr>
<td></td>
<td>This value identifies the PowerOn ResetMode, a simulated PowerOn reset that most ECUs perform after the ignition OFF/ON cycle. When the ECU performs the reset, the server (ECU) maintains communication with the client (tester).</td>
</tr>
<tr>
<td>03–7F</td>
<td><strong>Reserved</strong></td>
</tr>
<tr>
<td>80–FF</td>
<td><strong>ManufacturerSpecific</strong></td>
</tr>
<tr>
<td></td>
<td>This range of values is reserved for vehicle manufacturer-specific use.</td>
</tr>
</tbody>
</table>
Output

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

This function requests the ECU to perform an ECU reset effectively based on the mode value content. The vehicle manufacturer determines when the positive response message is sent.
ndEnableNormalMessageTransmission

**Purpose**
Executes the EnableNormalMessageTransmission service. The ECU starts transmitting its regular communication messages (usually CAN messages).

**Format**
```c
long ndEnableNormalMessageTransmission(
    TD1 *diagRef,
    LVBoolean *requireResponse,
    LVBoolean *success);
```

**Input**
- `diagRef`
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- `requireResponse`
  Indicates whether a response to this service is required. If `*requireResponse` is FALSE, no response is evaluated, and `success` is always returned TRUE. This parameter is passed by reference.

**Output**
- `success`
  Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
**ndInputOutputControlByLocalIdentifier**

**Purpose**

Executes the InputOutputControlByLocalIdentifier service. Modifies the ECU I/O port behavior.

**Format**

```c
long ndInputOutputControlByLocalIdentifier(
    TDl *diagRef,
    unsigned char localID,
    unsigned char mode,
    unsigned char dataIn[],
    long len,
    unsigned char dataOut[],
    long *len2,
    LVBoolean *success);
```

**Input**

- **diagRef**
  
  Specified the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **localID**

  Defines the local identifier of the I/O to be manipulated. The values are application specific.

- **mode**

  Defines the I/O control type. The values are application specific. The usual values are:
  - 0: ReturnControlToECU
  - 1: ReportCurrentState
  - 4: ResetToDefault
  - 5: FreezeCurrentState
  - 7: ShortTermAdjustment
  - 8: LongTermAdjustment

- **dataIn**

  Defines application-specific data for this service.

- **len**

  Must contain the number of valid data bytes in `dataIn`. 
Output
dataOut

Returns application-specific data for this service.

len2

On input, len2 must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

This function substitutes a value for an input signal or internal ECU function. It also controls an output (actuator) of an electronic system referenced by localID.

For further details about this service, refer to the ISO 14230-3 standard.
**ndReadDataByLocalIdentifier**

**Purpose**
Executes the ReadDataByLocalIdentifier service. Reads an ECU data record.

**Format**

```c
long ndReadDataByLocalIdentifier(
    TD1 *diagRef,
    unsigned char localID,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);
```

**Input**

- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **localID**
  Defines the local identifier of the data to be read. The values are application specific.

**Output**

- **dataOut**
  Returns the data record from the ECU. If you know the record data description, you can use the `ndConvertToPhys` function to interpret it.

- **len**
  On input, `len` must contain the `dataOut` array length. On return, it contains the number of valid data bytes in the `dataOut` array.

- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Description

This function requests data record values from the ECU identified by the `localID` parameter.

For further details about this service, refer to the ISO 14230-3 standard.
ndReadDTCByStatus

Purpose
Executes the ReadDiagnosticTroubleCodesByStatus service. Reads selected Diagnostic Trouble Codes (DTCs).

Format
```c
long ndReadDTCByStatus(
    TD1 *diagRef,
    unsigned char mode,
    unsigned short groupOfDTC,
    TD3 *DTCDescriptor,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);
```

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

mode
Defines the type of DTCs to be read. The values are application specific. The usual values are:

- 2: AllIdentified
- 3: AllSupported

groupOfDTC
Specifies the group of diagnostic trouble codes to be cleared. The following values have a special meaning:

- 0x0000 All powertrain DTCs
- 0x4000 All chassis DTCs
- 0x8000 All body DTCs
- 0xC000 All network related DTCs
- 0xFF00 All DTCs
DTCDescriptor

A struct that describes the DTC records the ECU delivers:

```c
typedef struct {
    long DTCByteLength;
    long StatusByteLength;
    long AddDataByteLength;
    unsigned short ByteOrder;
} TD3;
```

- **DTCByteLength** indicates the number of bytes the ECU sends for each DTC. The default is 2.
- **StatusByteLength** indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.
- **AddDataByteLength** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there are no additional data, so the default is 0.
- **ByteOrder** indicates the byte ordering for multibyte items:
  - 0: MSB_FIRST (Motorola), default
  - 1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs struct array.

**Output**

**DTCs**

Returns the resulting DTCs as an array of structs:

```c
typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;
```

- **DTC** is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use `ndDTCToString` to convert this code to readable format as defined by SAE J2012.
- **Status** is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
</tbody>
</table>
6 testNotCompletedThisMonitoringCycle
7 warningIndicatorRequested

AddData contains optional additional data for this DTC. Usually, this does not contain valid information (refer to DTCDescriptor).

len

On input, len must contain the DTCs array length in elements. On return, it contains the number of valid elements in the DTCs array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

This function reads diagnostic trouble codes by status from the ECU memory. If you set the optional groupOfDTC parameter to the above specified codes, the ECU reports DTCs only with status information based on the functional group selected by groupOfDTC.

For further details about this service, refer to the ISO 14230-3 standard.
ndReadECUIdentification

**Purpose**
Executes the ReadECUIdentification service. Returns ECU identification data.

**Format**
```c
long ndReadECUIdentification(
    TD1 *diagRef,
    unsigned char mode,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.
- **mode**
  Indicates the type of identification information to be returned. The values are application specific.

**Output**
- **dataOut**
  Returns the ECU identification data.
- **len**
  On input, `len` must contain the `dataOut` array length. On return, it contains the number of valid data bytes in the `dataOut` array.
- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Description

This function requests identification data from the ECU. `mode` identifies the type of identification data requested. The ECU returns identification data that `dataOut` can access. The `dataOut` format and definition are vehicle manufacturer specific.

For further details about this service, refer to the ISO 14230-3 standard.
ndReadMemoryByAddress

Purpose
Executes the ReadMemoryByAddress service. Reads data from the ECU memory.

Format

```c
long ndReadMemoryByAddress(
    TD1 *diagRef,
    unsigned long address,
    unsigned char size,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);
```

Input

diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or
ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it
is not necessary to manually manipulate the elements of this struct.

address
Defines the memory address from which data are read. Only three bytes are sent to the
ECU, so the address must be in the range 0–FFFFFF (hex).

size
Defines the length of the memory block to be read.

Output
dataOut
Returns the ECU memory data.

len
On input, len must contain the dataOut array length. On return, it contains the number
of valid data bytes in the dataOut array.

success
Indicates successful receipt of a positive response message for this diagnostic service.
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description
This function requests ECU memory data identified by the address and size parameters. The dataOut format and definition are vehicle manufacturer specific. dataOut includes analog input and output signals, digital input and output signals, internal data, and system status information if the ECU supports them.

For further details about this service, refer to the ISO 14230-3 standard.
ndReadStatusOfDTC

Purpose
Executes the ReadStatusOfDiagnosticTroubleCodes service. Reads selected Diagnostic Trouble Codes (DTCs).

Format
long ndReadStatusOfDTC(
    TD1 *diagRef,
    unsigned short groupOfDTC,
    TD3 *DTCDescriptor,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

groupOfDTC
Specifies the group of diagnostic trouble codes to be cleared. The following values have a special meaning:
- 0x0000 All powertrain DTCs
- 0x4000 All chassis DTCs
- 0x8000 All body DTCs
- 0xC000 All network related DTCs
- 0xFF00 All DTCs

DTCDescriptor
A struct that describes the DTC records the ECU delivers:

typedef struct {
    long DTCByteLength;
    long StatusByteLength;
    long AddDataByteLength;
    unsigned short ByteOrder;
} TD3;

DTCByteLength indicates the number of bytes the ECU sends for each DTC. The default is 2.
StatusByteLength indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.

AddDataByteLength indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there are no additional data, so the default is 0.

ByteOrder indicates the byte ordering for multibyte items:

0: MSB_FIRST (Motorola), default
1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs struct array.

Output

DTCs

Returns the resulting DTCs as an array of structs:

typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use ndDTCToString to convert this code to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

AddData contains optional additional data for this DTC. Usually, this does not contain valid information (refer to DTCDescriptor).

len

On input, len must contain the DTCs array length in elements. On return, it contains the number of valid elements in the DTCs array.

success

Indicates successful receipt of a positive response message for this diagnostic service.
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description
This function reads diagnostic trouble codes from the ECU memory. If you specify `groupOfDTC`, the ECU reports DTCs based only on the functional group selected by `groupOfDTC`.

For further details about this service, refer to the ISO 14230-3 standard.
ndRequestRoutineResultsByLocalIdentifier

Purpose
Executes the RequestRoutineResultsByLocalIdentifier service. Returns results from an ECU routine.

Format
long ndRequestRoutineResultsByLocalIdentifier(
    TDI *diagRef,
    unsigned char localID,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

localID
Defines the local identifier of the routine from which this function retrieves results. The values are application specific.

Output
dataOut
Returns application-specific output parameters from the routine.

len
On input, len must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
Description

This function requests results (for example, exit status information) referenced by `localID` and generated by the routine executed in the ECU memory.

For further details about this service, refer to the ISO 14230-3 standard.
**ndRequestSeed**

**Purpose**
Executes the SecurityAccess service to retrieve a seed from the ECU.

**Format**

```c
long ndRequestSeed(
    TD1 *diagRef,
    unsigned char accessMode,
    unsigned char seedOut[],
    long *len,
    LVBoolean *success);
```

**Input**

- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **accessMode**
  Indicates the security level to be granted. The values are application specific. This is an odd number, usually 1.

**Output**

- **seedOut**
  Returns the seed from the ECU.

- **len**
  On input, `len` must contain the `seedOut` array length. On return, it contains the number of valid data bytes in the `seedOut` array.

- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Description

The usual procedure for getting a security access to the ECU is as follows:

1. Request a seed from the ECU using ndRequestSeed with access mode = n.
2. From the seed, compute a key for the ECU on the host.
3. Send the key to the ECU using ndSendKey with access mode = n + 1.
4. The security access is granted if the ECU validates the key sent. Otherwise, an error is returned.
**ndSendKey**

**Purpose**
Executes the SecurityAccess service to send a key to the ECU.

**Format**

```c
long ndSendKey(
    TD1 *diagRef,
    unsigned char accessMode,
    unsigned char keyIn[],
    long len,
    LVBoolean *success);
```

**Input**

diagRef
Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

accessMode
Indicates the security level to be granted. The values are application specific. This is an even number, usually 2.

keyIn
Defines the key data to be sent to the ECU.

len
Must contain the number of valid data bytes in `keyIn`.

**Output**

success
Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
The usual procedure for getting a security access to the ECU is as follows:

1. Request a seed from the ECU using `ndRequestSeed` with access mode = \( n \).
2. From the seed, compute a key for the ECU on the host.
3. Send the key to the ECU using `ndSendKey` with access mode = \( n + 1 \).
4. The security access is granted if the ECU validates the key sent. Otherwise, an error is returned.
ndStartDiagnosticSession

Purpose
Executes the StartDiagnosticSession service. The ECU is set up in a specific diagnostic mode.

Format
long ndStartDiagnosticSession(
    TD1 *diagRef,
    unsigned char mode,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

diagRef
Indicates the diagnostic mode into which the ECU is brought. The values are application specific.

Output
success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description
This function enables different ECU diagnostic modes. The possible diagnostic modes are not defined in ISO 14230 and are application specific. A diagnostic session starts only if communication with the ECU is established. For more details about starting communication, refer to ISO 14230-2. If no diagnostic session is requested after ndOpenDiagnostic, a default session is enabled automatically in the ECU. The default session supports at least the following services:

- The StopCommunication service (refer to ndCloseDiagnostic and the ISO 14230-2 standard).
- The TesterPresent service (refer to ndTesterPresent and the ISO 14230-3 standard).
**ndStartRoutineByLocalIdentifier**

**Purpose**
Executes the StartRoutineByLocalIdentifier service. Executes a routine on the ECU.

**Format**
```c
long ndStartRoutineByLocalIdentifier(
    TD1 *diagRef,
    unsigned char localID,
    unsigned char dataIn[],
    long len,
    unsigned char dataOut[],
    long *len2,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.
- **localID**
  Defines the local identifier of the routine to be started. The values are application specific.
- **dataIn**
  Defines application-specific input parameters for the routine.
- **len**
  Must contain the number of valid data bytes in `dataIn`.

**Output**
- **dataOut**
  Returns application-specific output parameters from the routine.
- **len2**
  On input, `len2` must contain the `dataOut` array length. On return, it contains the number of valid data bytes in the `dataOut` array.
- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.
Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

This function starts a routine in the ECU memory. The ECU routine starts after the positive response message is sent. The routine stops until the ndStopRoutineByLocalIdentifier function and corresponding service are issued. The routines could be either tests that run instead of normal operating code or routines enabled and executed with the normal operating code running. In the first case, you may need to switch the ECU to a specific diagnostic mode using ndOpenDiagnostic or unlock the ECU using the SecurityAccess service prior to using ndStartRoutineByLocalIdentifier.

For further details about this service, refer to the ISO 14230-3 standard.
### ndStopDiagnosticSession

**Purpose**
Executes the StopDiagnosticSession service. Returns the ECU to normal mode.

**Format**
```c
long ndStopDiagnosticSession(
    TD1 *diagRef,
    LVBoolean *success);
```

**Input**
- `diagRef` Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

**Output**
- `success` Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**
This function disables the current ECU diagnostic mode. A diagnostic session stops only if communication with the ECU is established and a diagnostic session is running. If no diagnostic session is running, the default session is active. `ndStopDiagnosticSession` cannot disable the default session. If the ECU stops the current diagnostic session, it performs the necessary action to restore its normal operating conditions. Restoring the normal ECU operating conditions may include resetting all controlled actuators activated during the diagnostic session being stopped, and resuming all normal ECU algorithms. You should call `ndStopDiagnosticSession` before disabling communication with `ndCloseDiagnostic`, but only if you previously used `ndStartDiagnosticSession`.

© National Instruments Corporation 6-87 Automotive Diagnostic Command Set User Manual
ndStopRoutineByLocalIdentifier

Purpose
Executes the StopRoutineByLocalIdentifier service. Stops a routine on the ECU.

Format

long ndStopRoutineByLocalIdentifier(
    TD1 *diagRef,
    unsigned char localID,
    unsigned char dataIn[],
    long len,
    unsigned char dataOut[],
    long *len2,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

localID
Defines the local identifier of the routine to be stopped. The values are application specific.

dataIn
Defines application-specific input parameters for the routine.

len
Must contain the number of valid data bytes in dataIn.

Output
dataOut
Returns application-specific output parameters from the routine.

len2
On input, len2 must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success
Indicates successful receipt of a positive response message for this diagnostic service.
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description
This function stops a routine in the ECU memory referenced by `localID`.

For further details about this service, refer to the ISO 14230-3 standard.
ndTesterPresent

**Purpose**
Executes the TesterPresent service. Keeps the ECU in diagnostic mode.

**Format**
```c
long ndTesterPresent(
    TDL *diagRef,
    LVBoolean *requireResponse,
    LVBoolean *success);
```

**Input**

`diagRef`
Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

`requireResponse`
Indicates whether a response to this service is required. If `*requireResponse` is `FALSE`, no response is evaluated, and `success` is always returned `TRUE`. This parameter is passed by reference.

**Output**

`success`
Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Description

To ensure proper ECU operation, you may need to keep the ECU informed that a diagnostic session is still in progress. If you do not send this information (for example, because the communication is broken), the ECU returns to normal mode from diagnostic mode after a while.

The TesterPresent service is this “keep alive” signal. It does not affect any other ECU operation.

Keep calling ndTesterPresent within the ECU timeout period if no other service is executed.
ndWriteDataByLocalIdentifier

Purpose
Executes the WriteDataByLocalIdentifier service. Writes a data record to the ECU.

Format
long ndWriteDataByLocalIdentifier(
    TD1 *diagRef,
    unsigned char localID,
    unsigned char dataIn[],
    long len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

localID
Defines the local identifier of the data to be read. The values are application specific.

dataIn
Defines the data record to be written to the ECU. If you know the record data description, use ndConvertFromPhys to generate this record.

len
Must contain the number of valid data bytes in dataIn.

Output
success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
Description

This function performs the WriteDataByLocalIdentifier service and writes RecordValues (data values) to the ECU. `dataIn` identifies the data values to be transmitted. The vehicle manufacturer must ensure the ECU conditions are met when performing this service. Typical use cases are clearing nonvolatile memory, resetting learned values, setting option content, setting the Vehicle Identification Number, or changing calibration values.

For further details about this service, refer to the ISO 14230-3 standard.
ndWriteMemoryByAddress

Purpose
Executes the WriteMemoryByAddress service. Writes data to the ECU memory.

Format
```c
long ndWriteMemoryByAddress(
    TD1 *diagRef,
    unsigned long address,
    unsigned char size,
    unsigned char dataIn[],
    long len,
    LVBoolean *success);
```

Input

`diagRef`
Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

`address`
Defines the memory address to which data are written. Only three bytes are sent to the ECU, so the address must be in the range 0–FFFFFF (hex).

`size`
Defines the length of the memory block to be written.

`dataIn`
Defines the memory block to be written to the ECU.

`len`
Must contain the number of valid data bytes in `dataIn`. 
Output

**success**

Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

**Description**

This VI performs the KWP2000 WriteDataByAddress service and writes RecordValues (data values) to the ECU. `address` and `size` identify the data. The vehicle manufacturer must ensure the ECU conditions are met when performing this service. Typical use cases are clearing nonvolatile memory, resetting learned values, setting option content, setting the Vehicle Identification Number, or changing calibration values.

For further details about this service, refer to the ISO 14230-3 standard.
UDS (DiagOnCAN) Services

ndUDSClearDiagnosticInformation

Purpose
Executes the UDS ClearDiagnosticInformation service. Clears selected Diagnostic Trouble Codes (DTCs).

Format
\[
\text{long ndUDSClearDiagnosticInformation(}
\text{TD1 *diagRef,}
\text{unsigned long groupOfDTC,}
\text{LVBoolean *success);}\]

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

groupOfDTC
Specifies the group of diagnostic trouble codes to be cleared. The values are application specific. The following value has a special meaning:
\[0xFFFFFF\] All DTCs

Output
success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
Description

This function clears the diagnostic information on the ECU memory. Depending on the value of `groupOfDTC`, the ECU is requested to clear the corresponding DTCs. The `groupOfDTC` values are application specific.

For further details about this service, refer to the ISO 15765-3 standard.
**ndUDSCommunicationControl**

**Purpose**
Executes the UDS CommunicationControl service. Switches transmission and/or reception of the normal communication messages (usually CAN messages) on or off.

**Format**

```c
long ndUDSCommunicationControl(
    TD1 *diagRef,
    unsigned char type,
    unsigned char communicationType,
    LVBoolean *success);
```

**Input**

*diagRef*
Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

*type*
Indicates whether transmission/reception is to be switched on/off. The usual values are:

- 00: enableRxAndTx
- 01: enableRxAndDisableTx
- 02: disableRxAndEnableTx
- 03: disableRxAndTx

*communicationType*
A bitfield indicating which application level is to be changed. The usual values are:

- 01: application
- 02: networkManagement

You can change more than one level at a time.
Output

`success`

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description

This function executes the UDS CommunicationControl service and switches transmission and/or reception of the normal communication messages (usually CAN messages) on or off. The `type` and `communication type` parameters are vehicle manufacturer specific (one OEM may disable the transmission only, while another OEM may disable the transmission and reception based on vehicle manufacturer specific needs). The request is either transmitted functionally addressed to all ECUs with a single request message, or transmitted physically addressed to each ECU in a separate request message.
ndUDSControlDTCSetting

Purpose
Executes the UDS ControlDTCSetting service. Modifies Diagnostic Trouble Code (DTC) behavior.

Format
long ndUDSControlDTCSetting(
    TD1 *diagRef,
    unsigned char type,
    unsigned char dataIn[],
    long len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

type
Specifies the control mode:
1: on
2: off

dataIn
Specifies application-specific data that control DTC generation.

len
Must contain the number of valid data bytes in dataIn.

Output
success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
ndUDSDiagnosticSessionControl

Purpose
Executes the UDS DiagnosticSessionControl service. The ECU is set up in a specific diagnostic mode.

Format
long ndUDSDiagnosticSessionControl(
   TD1 *diagRef,
   unsigned char mode,
   LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

mode
Indicates the diagnostic mode into which the ECU is brought. The values are application specific. The usual values are:
   01: defaultSession
   02: ECUProgrammingSession
   03: ECUExtendedDiagnosticSession

Output
success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
ndUDSECUReset

Purpose
Executes the UDS ECUReset service. Resets the ECU.

Format
long ndUDSECUReset(
    TD1 *diagRef,
    unsigned char mode,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

mode
Indicates the reset mode:

<table>
<thead>
<tr>
<th>Hex</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>hardReset</td>
</tr>
<tr>
<td>02</td>
<td>keyOffOnReset</td>
</tr>
<tr>
<td>03</td>
<td>softReset</td>
</tr>
<tr>
<td>04</td>
<td>enableRapidPowerShutDown</td>
</tr>
<tr>
<td>05</td>
<td>disableRapidPowerShutDown</td>
</tr>
</tbody>
</table>

Output
success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
Description

This function requests the ECU to perform an ECU reset effectively based on the `mode` parameter value content. The vehicle manufacturer determines when the positive response message is sent. Depending on the value of `mode`, the corresponding ECU reset event is executed as a hard reset, key off/on reset, soft reset, or other reset.

For further details about this service, refer to the ISO 15765-3 standard.
**ndUDSInputOutputControlByIdentifier**

**Purpose**
Executes the UDS InputOutputControlByIdentifier service. Modifies ECU I/O port behavior.

**Format**
```
long ndUDSInputOutputControlByIdentifier(
    TDI *diagRef,
    unsigned short ID,
    unsigned char mode,
    unsigned char dataIn[],
    long len,
    unsigned char dataOut[],
    long *len2,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **ID**
  Defines the identifier of the I/O to be manipulated. The values are application specific.

- **mode**
  Defines the I/O control type. The values are application specific. The usual values are:
  - 0: ReturnControlToECU
  - 1: ResetToDefault
  - 2: FreezeCurrentState
  - 3: ShortTermAdjustment

- **dataIn**
  Defines application-specific data for this service.

- **len**
  Must contain the number of valid data bytes in `dataIn`. 
Output

dataOut

Returns application-specific data for this service.

len2

On input, len2 must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

This function substitutes a value for an input signal or internal ECU function. It also controls an output (actuator) of an electronic system referenced by the ID parameter.

For further details about this service, refer to the ISO 15765-3 standard.
ndUDSReadDataByIdentifier

Purpose
Executes the UDS ReadDataByIdentifier service. Reads an ECU data record.

Format
long ndUDSReadDataByIdentifier(
    TD1 *diagRef,
    unsigned short ID,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

ID
Defines the identifier of the data to be read. The values are application specific.

Output
dataOut
Returns the ECU data record. If you know the record data description, use ndConvertToPhys to interpret this record.

len
On input, len must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
Description

This function requests data record values from the ECU identified by the ID parameter.

For further details about this service, refer to the ISO 15765-3 standard.
ndUDSReadMemoryByAddress

Purpose
Executes the UDS ReadMemoryByAddress service. Reads data from the ECU memory.

Format
```
long ndUDSReadMemoryByAddress(
    TD1 *diagRef,
    unsigned long address,
    unsigned char size,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);
```

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

address
Defines the memory address from which data are read. Only three bytes are sent to the ECU, so the address must be in the range 0–FFFFFF (hex).

size
Defines the length of the memory block to be read.

Output
dataOut
Returns the ECU memory data.

len
On input, len must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success
Indicates successful receipt of a positive response message for this diagnostic service.
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description
This function requests memory data from the ECU identified by the address and size parameters. The dataOut format and definition are vehicle manufacturer specific. dataOut includes analog input and output signals, digital input and output signals, internal data, and system status information if the ECU supports them.

For further details about this service, refer to the ISO 15765-3 standard.
**ndUDSReportDTCBySeverityMaskRecord**

**Purpose**
Executes the ReportDTCBySeverityMaskRecord subfunction of the UDS ReadDiagnosticTroubleCodeInformation service. Reads selected Diagnostic Trouble Codes (DTCs).

**Format**
```c
long ndUDSReportDTCBySeverityMaskRecord(
    TD1 *diagRef,
    unsigned char severityMask,
    unsigned char status,
    TD3 *DTCDescriptor,
    unsigned char *statusAvailMask,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.
- **severityMask**
  Defines the status of DTCs to be read. The values are application specific.
- **status**
  Defines the status of DTCs to be read. The values are application specific.
- **DTCDescriptor**
  A struct that describes the DTC records the ECU delivers:
  ```c
typedef struct {
    long DTCByteLength;
    long StatusByteLength;
    long AddDataByteLength;
    unsigned short ByteOrder;
  } TD3;
  ```
  DTCByteLength indicates the number of bytes the ECU sends for each DTC. The default is 3 for UDS.
StatusByteLength indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.

AddDataByteLength indicates the number of bytes the ECU sends for each DTC’s additional data. For this subfunction, the default is 2.

ByteOrder indicates the byte ordering for multibyte items:

0: MSB_FIRST (Motorola), default
1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs struct array.

**Output**

statusAvailMask

An application-specific value returned for all DTCs.

DTCs

Returns the resulting DTCs as an array of structs:

```c
typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;
```

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use `ndDTCToString` to convert this code to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

AddData contains optional additional data for this DTC.
len

On input, len must contain the DTCs array length in elements. On return, it contains the number of valid elements in the DTCs array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

This function executes the ReportDTCBySeverityMaskRecord subfunction of the UDS ReadDiagnosticTroubleCodeInformation service and reads the selected DTCs.

For further details about this service, refer to the ISO 15765-3 standard.
ndUDSReportDTCByStatusMask

Purpose
Executes the ReportDTCByStatusMask subfunction of the UDS ReadDiagnosticTroubleCodeInformation service. Reads selected Diagnostic Trouble Codes (DTCs).

Format
long ndUDSReportDTCByStatusMask(
    TD1 *diagRef,
    unsigned char statusMask,
    TD3 *DTCDescriptor,
    unsigned char *statusAvailMask,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

statusMask
 Defines the status of DTCs to be read. The values are application specific.

DTCDescriptor
A struct that describes the DTC records the ECU delivers:

typedef struct {
    long DTCByteLength;
    long StatusByteLength;
    long AddDataByteLength;
    unsigned short ByteOrder;
} TD3;

DTCByteLength indicates the number of bytes the ECU sends for each DTC. The default is 3 for UDS.

StatusByteLength indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.

AddDataByteLength indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there are no additional data, so the default is 0.
ByteOrder indicates the byte ordering for multibyte items:

0: MSB_FIRST (Motorola), default
1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs struct array.

Output

statusAvailMask
An application-specific value returned for all DTCs.

DTCs
Returns the resulting DTCs as an array of structs:

```c
typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;
```

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use `ndDTCToString` to convert this code to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

AddData contains optional additional data for this DTC. Usually, this does not contain valid information (refer to `DTCDescriptor`).

len
On input, len must contain the DTCs array length in elements. On return, it contains the number of valid elements in the DTCs array.

success
Indicates successful receipt of a positive response message for this diagnostic service.
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description
This function executes the ReportDTCByStatusMask subfunction of the UDS ReadDiagnosticTroubleCodeInformation service and reads the selected DTCs from the ECU.

For further details about this service, refer to the ISO 15765-3 standard.
ndUDSReportSeverityInformationOfDTC

Purpose
Executes the ReportSeverityInformationOfDTC subfunction of the UDS ReadDiagnosticTroubleCodeInformation service. Reads selected Diagnostic Trouble Codes (DTCs) are read.

Format
long ndUDSReportSeverityInformationOfDTC(
    TD1 *diagRef,
    unsigned long DTCMaskRecord,
    TD3 *DTCDescriptor,
    unsigned char *statusAvailMask,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

DTCMaskRecord
Defines the status of DTCs to be read. The values are application specific.

DTCDescriptor
A struct that describes the DTC records the ECU delivers:

typedef struct {
    long DTCByteLength;
    long StatusByteLength;
    long AddDataByteLength;
    unsigned short ByteOrder;
} TD3;

DTCByteLength indicates the number of bytes the ECU sends for each DTC. The default is 3 for UDS.

StatusByteLength indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.

AddDataByteLength indicates the number of bytes the ECU sends for each DTC’s additional data. For this subfunction, the default is 2.
ByteOrder indicates the byte ordering for multibyte items:

0: MSB_FIRST (Motorola), default
1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs struct array.

Output

statusAvailMask
An application-specific value returned for all DTCs.

DTCs
Returns the resulting DTCs as an array of structs:

```c
typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;
```

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use `ndDTCToString` to convert this code to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

AddData contains optional additional data for this DTC.

len
On input, len must contain the DTCs array length in elements. On return, it contains the number of valid elements in the DTCs array.

success
Indicates successful receipt of a positive response message for this diagnostic service.
Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description
This function executes the ReportSeverityInformationOfDTC subfunction of the UDS ReadDiagnosticTroubleCodeInformation service and reads the selected DTCs from the ECU memory.

For further details about this service, refer to the ISO 15765-3 standard.
### ndUDSReportSupportedDTCs

**Purpose**
Executes the ReportSupportedDTCs subfunction of the UDS ReadDiagnosticTroubleCodeInformation service. Reads all supported Diagnostic Trouble Codes (DTCs).

**Format**

```c
long ndUDSReportSupportedDTCs(
    TD1 *diagRef,
    TD3 *DTCDescriptor,
    unsigned char *statusAvailMask,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);
```

**Input**

- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **DTCDescriptor**
  A struct that describes the DTC records the ECU delivers:
  ```c
typedef struct {
    long DTCByteLength;
    long StatusByteLength;
    long AddDataByteLength;
    unsigned short ByteOrder;
  } TD3;
```
  - **DTCByteLength** indicates the number of bytes the ECU sends for each DTC. The default is 3 for UDS.
  - **StatusByteLength** indicates the number of bytes the ECU sends for each DTC’s status. The default is 1.
  - **AddDataByteLength** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there are no additional data, so the default is 0.
  - **ByteOrder** indicates the byte ordering for multibyte items:
    - 0: MSB_FIRST (Motorola), default
    - 1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the `DTCs` struct array.
Output

statusAvailMask

An application-specific value returned for all DTCs.

DTCs

Returns the resulting DTCs as an array of structs:

typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use

ndDTCToString

to convert this code to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

AddData contains optional additional data for this DTC. Usually, this does not
contain valid information (refer to DTCDescriptor).

len

On input, len must contain the DTCs array length in elements. On return, it contains the
number of valid elements in the DTCs array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the
function executed successfully. A negative value specifies an error, which means the function
did not perform the expected behavior. A positive value specifies a warning, which means the
function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
Description

This function executes the ReportSupportedDTCs subfunction of the UDS ReadDiagnostic TroubleCodeInformation service and reads all supported DTCs from the ECU memory.

For further details about this service, refer to the ISO 15765-3 standard.
ndUDSRequestDownload

Purpose
Initiates a download of data to the ECU.

Format
long ndUDSRequestDownload (  
  TD1 *diagRef,  
  unsigned long memoryAddress,  
  unsigned long memorySize,  
  unsigned char memoryAddressLength,  
  unsigned char memorySizeLength,  
  unsigned char dataFormatIdentifier,  
  unsigned long *blockSize,  
  LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

memoryAddress
Defines the memory address to which data are to be written.

memorySize
Defines the size of the data to be written.

memoryAddressLength
Defines the number of bytes of the memoryAddress parameter that are written to the ECU. This value is implementation dependent and must be in the range of 1–4. For example, if this value is 2, only the two lowest bytes of the address are written to the ECU.

memorySizeLength
Defines the number of bytes of the memorySize parameter that are written to the ECU. This value is implementation dependent and must be in the range of 1–4. For example, if this value is 2, only the two lowest bytes of the size are written to the ECU.

dataFormatIdentifier
Defines the compression and encryption scheme for the data blocks written to the ECU. A value of 0 means no compression/no encryption. Nonzero values are not standardized and implementation dependent.
Output

`blockSize`

Returns the number of data bytes to be transferred to the ECU in subsequent `ndUDSTransferData` requests.

`succeed`

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description

`ndUDSRequestDownload` initiates the download of a data block to the ECU. This is required to set up the download process; the actual data transfer occurs with subsequent `ndUDSTransferData` requests. The transfer must occur in blocks of the size this service returns (the `blockSize` parameter). After the download completes, use the `ndUDSRequestTransferExit` service to terminate the process.
ndUDSRequestSeed

Purpose
Executes the UDS SecurityAccess service to retrieve a seed from the ECU.

Format

long ndUDSRequestSeed(
    TD1 *diagRef,
    unsigned char accessMode,
    unsigned char seedOut[],
    long *len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

accessMode
Indicates the security level to be granted. The values are application specific. This is an odd number, usually 1.

Output
seedOut
Returns the seed from the ECU.

len
On input, len must contain the seedOut array length. On return, it contains the number of valid data bytes in the seedOut array.

success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
Description
The usual procedure for getting a security access to the ECU is as follows:
1. Request a seed from the ECU using `ndUDSRequestSeed` with access mode = n.
2. From the seed, compute a key for the ECU on the host.
3. Send the key to the ECU using `ndUDSSendKey` with access mode = n + 1.
4. The security access is granted if the ECU validates the key sent. Otherwise, an error is returned.
ndUDSRequestTransferExit

Purpose
Terminates a download/upload process.

Format
```
long ndUDSRequestTransferExit ( 
  TD1 *diagRef, 
  unsigned char dataIn[], 
  long len, 
  unsigned char dataOut[], 
  long *len2, 
  LVBoolean *success);
```

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or
ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it
is not necessary to manually manipulate the elements of this struct.

dataIn
Defines a data record to be written to the ECU as part of the termination process.
The meaning is implementation dependent; this may be a checksum or a similar
verification instrument.

len
Must be set to the buffer size for the dataIn parameter.

Output
dataOut
Returns a memory data block from the ECU as part of the termination process. The
meaning is implementation dependent; this may be a checksum or a similar verification
instrument.

len2
Must be set to the buffer size for the dataOut parameter. On return, it contains the actual
data size returned in dataOut.

success
Indicates successful receipt of a positive response message for this diagnostic service.
Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description

`ndUDSRequestTransferExit` terminates a download or upload process initialized with `ndUDSRequestDownload` or `ndUDSRequestUpload`. 
ndUDSRequestUpload

Purpose
Initiates an upload of data from the ECU.

Format
long ndUDSRequestUpload (  
    TD1 *diagRef,  
    unsigned long memoryAddress,  
    unsigned long memorySize,  
    unsigned char memoryAddressLength,  
    unsigned char memorySizeLength,  
    unsigned char dataFormatIdentifier,  
    unsigned long *blockSize,  
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

memoryAddress
Defines the memory address from which data are to be read.

memorySize
Defines the size of the data to be read.

memoryAddressLength
Defines the number of bytes of the memoryAddress parameter that are written to the ECU. This value is implementation dependent and must be in the range of 1–4. For example, if this value is 2, only the two lowest bytes of the address are written to the ECU.

memorySizeLength
Defines the number of bytes of the memorySize parameter that are written to the ECU. This value is implementation dependent and must be in the range of 1–4. For example, if this value is 2, only the two lowest bytes of the size are written to the ECU.

dataFormatIdentifier
Defines the compression and encryption scheme used for the data blocks written to the ECU. A value of 0 means no compression/no encryption. Nonzero values are not standardized and implementation dependent.
Output

blockSize

Returns the number of data bytes to be transferred from the ECU in subsequent

ndUDSTransferData requests.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the
function executed successfully. A negative value specifies an error, which means the function
did not perform the expected behavior. A positive value specifies a warning, which means the
function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

ndUDSRequestUpload initiates the upload of a data block from the ECU. This is
required to set up the upload process; the actual data transfer occurs with subsequent
ndUDSTransferData requests. The transfer must occur in blocks of the size that this service
returns (the blockSize parameter). After the download completes, use the
ndUDSRequestTransferExit service to terminate the process.
**ndUDSRoutineControl**

**Purpose**
Executes the UDS RoutineControl service. Executes a routine on the ECU.

**Format**
```c
long ndUDSRoutineControl(
    TD1 *diagRef,
    unsigned short ID,
    unsigned char mode,
    unsigned char dataIn[],
    long len,
    unsigned char dataOut[],
    long *len2,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **ID**
  Defines the identifier of the routine to be started. The values are application specific.

- **mode**
  Defines the operation mode for this service:
  - 1: Start Routine
  - 2: Stop Routine
  - 3: Request Routine Results
  Other values are application specific.

- **dataIn**
  Defines application-specific input parameters for the routine.

- **len**
  Must contain the number of valid data bytes in `dataIn`. 
Output

dataOut

Returns application-specific output parameters from the routine.

len2

On input, len2 must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

This function executes the UDS RoutineControl service and launches an ECU routine, stops an ECU routine, or requests ECU routine results from the ECU.

For further details about this service, refer to the ISO 15765-3 standard.
ndUDSSendKey

Purpose
Executes the UDS SecurityAccess service to send a key to the ECU.

Format

```c
long ndUDSSendKey(
    TD1 *diagRef,
    unsigned char accessMode,
    unsigned char keyIn[],
    long len,
    LVBoolean *success);
```

Input

**diagRef**
Specifies the diagnostic session handle, obtained from *ndOpenDiagnostic* or *ndOpenDiagnosticOnIP* and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

**accessMode**
Indicates the security level to be granted. The values are application specific. This is an even number, usually 2.

**keyIn**
Defines the key data to be sent to the ECU.

**len**
Must contain the number of valid data bytes in *keyIn*.

Output

**success**
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the *ndStatusToString* function to obtain a descriptive string for the return value.
Description

The usual procedure for getting a security access to the ECU is as follows:

1. Request a seed from the ECU using `ndUDSRequestSeed` with access mode = \( n \).
2. From the seed, compute a key for the ECU on the host.
3. Send the key to the ECU using `ndUDSSendKey` with access mode = \( n + 1 \).
4. The security access is granted if the ECU validates the key sent. Otherwise, an error is returned.
### ndUDSTesterPresent

**Purpose**
Executes the UDS TesterPresent service. Keeps the ECU in diagnostic mode.

**Format**
```c
long ndUDSTesterPresent(
    TDI *diagRef,
    LVBoolean *requireResponse,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **requireResponse**
  Indicates whether a response to this service is required. If `*requireResponse` is FALSE, no response is evaluated, and `success` is always returned TRUE. This parameter is passed by reference.

**Output**
- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Description

To ensure proper ECU operation, you may need to keep the ECU informed that a diagnostic session is still in progress. If you do not send this information (for example, because the communication is broken), the ECU returns to normal mode from diagnostic mode after a while.

The TesterPresent service is this “keep alive” signal. It does not affect any other ECU operation.

Keep calling ndUDSTesterPresent within the ECU timeout period if no other service is executed.
**ndUDSTransferData**

**Purpose**
Transfers data to/from the ECU in a download/upload process.

**Format**
```c
long ndUDSTransferData (  
    TD1 *diagRef,  
    unsigned char *blockSequenceCounter,  
    unsigned char dataIn[],  
    long len,  
    unsigned char dataOut[],  
    long *len2,  
    LVBoolean *success);
```

**Input**

* diagRef
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

* blockSequenceCounter
  Used to number the data blocks to be transferred to/from the ECU. The block sequence counter value starts at 01 hex with the first `ndUDSTransferData` request that follows the `ndUDSRequestDownload` or `ndUDSRequestUpload` service. Its value is incremented by 1 for each subsequent `ndUDSTransferData` request. At the value of FF hex, the block sequence counter rolls over and starts at 00 hex with the next `ndUDSTransferData` request. The block sequence counter is updated automatically, and the updated value is returned.

* dataIn
  Defines the data block to be written to the ECU. For a download, this is a memory data block to be downloaded to the ECU. For an upload, the meaning is implementation dependent.

* len
  Must be set to the buffer size for the dataIn parameter.
Output

blockSequenceCounter

Returns the updated value of the block sequence counter (refer to the description in the Input section).

dataOut

Returns the memory data from the ECU.
For a download, this may contain a checksum or similar verification instrument; the meaning is implementation dependent.
For an upload, this is a memory data block uploaded from the ECU.

len2

Must be set to the buffer size for the dataOut parameter. On return, it contains the actual data size returned in dataOut.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

ndUDSTransferData executes the data transfer of a download process (initiated with a previous ndUDSRequestDownload request) or an upload process (initiated with a previous ndUDSRequestUpload request). The data transfer must occur in blocks of the size that has been returned in the block size parameter of the respective request service. After the data transfer completes, terminate the operation by calling the ndUDSRequestTransferExit service.
ndUDSWriteDataByIdentifier

**Purpose**
Executes the UDS WriteDataByIdentifier service. Writes a data record to the ECU.

**Format**
```
long ndUDSWriteDataByIdentifier(
    TD1 *diagRef,
    unsigned short ID,
    unsigned char dataIn[],
    long len,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **ID**
  Defines the identifier of the data to be read. The values are application specific.

- **dataIn**
  Defines the data record written to the ECU. If you know the record data description, use `ndConvertFromPhys` to generate this record.

- **len**
  Must contain the number of valid data bytes in `dataIn`.

**Output**
- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.

**Return Value**
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Description

This function performs the UDS service WriteDataByIdentifier and writes RecordValues (data values) into the ECU. dataIn identifies the data. The vehicle manufacturer must ensure the ECU conditions are met when performing this service. Typical use cases are clearing nonvolatile memory, resetting learned values, setting option content, setting the Vehicle Identification Number, or changing calibration values.

For further details about this service, refer to the ISO 15765-3 standard.
ndUDSWriteMemoryByAddress

Purpose
Executes the UDS WriteMemoryByAddress service. Writes data to the ECU memory.

Format
```c
long ndUDSWriteMemoryByAddress(
    TD1 *diagRef,
    unsigned long address,
    unsigned char size,
    unsigned char dataIn[],
    long len,
    LVBoolean *success);
```

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

address
Defines the memory address to which data are written. Only three bytes are sent to the ECU, so the address must be in the range 0–FFFFFF (hex).

size
Defines the length of the memory block to be written.

dataIn
Defines the memory block to be written to the ECU.

len
Must contain the number of valid data bytes in dataIn.
Output

**success**

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description

This function performs the UDS service `WriteMemoryByAddress` and writes `RecordValues` (data values) into the ECU. `address` and `size` identify the data. The vehicle manufacturer must ensure the ECU conditions are met when performing this service. Typical use cases are clearing nonvolatile memory, resetting learned values, setting option content, setting the Vehicle Identification Number, or changing calibration values.

For further details about this service, refer to the ISO 15765-3 standard.
**ndUDS06ReadMemoryByAddress**

Executes the UDS ReadMemoryByAddress service. Reads data from the ECU memory.

**Format**

```c
long ndUDS06ReadMemoryByAddress(
    TD1 *diagRef,
    unsigned char memAddrLen,
    unsigned char memSizeLen,
    unsigned long address,
    unsigned long size,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);
```

**Input**

* diagRef
  Specifies the handle for the diagnostic session, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

* memAddrLen
  Defines the number of address bytes transferred to the ECU. This implicitly defines the maximum allowed for the address parameter.

* memSizeLen
  Defines the number of size bytes transferred to the ECU. This implicitly defines the maximum allowed for the size parameter.

* address
  Defines the memory address from which data are read.

* size
  Defines the length of the memory block to be read.
Output

`dataOut`
Returns the memory data from the ECU.

`len`
On input, `len` must contain the `dataOut` array length. On return, it contains the number of valid data bytes in the `dataOut` array.

`success`
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.

Description

Similar to `ndUDSReadMemoryByAddress`. You can define the address and size parameter sizes in bytes.
ndUDS06WriteMemoryByAddress

Purpose
Executes the UDS WriteMemoryByAddress service. Writes data to the ECU memory.

Format
long ndUDS06WriteMemoryByAddress(
    TD1 *diagRef,
    unsigned char memAddrLen,
    unsigned char memSizeLen,
    unsigned long address,
    unsigned long size,
    unsigned char dataIn[],
    long len,
    LVBoolean *success);

Input
diagRef
Specifies the handle for the diagnostic session, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

memAddrLen
Defines the number of address bytes transferred to the ECU. This implicitly defines the maximum allowed for the address parameter.

memSizeLen
Defines the number of size bytes transferred to the ECU. This implicitly defines the maximum allowed for the size parameter.

address
Defines the memory address to which data are written.

size
Defines the length of the memory block to be written.

dataIn
Defines the memory block to be written to the ECU.

len
Must contain the number of (valid) data bytes in dataIn.
Output

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.

Description

Similar to the ndUDSWriteMemoryByAddress. You can define the address and size parameter sizes in bytes.
OBD (On-Board Diagnostics) Services

ndOBDClearEmissionRelatedDiagnosticInformation

Purpose
Executes the OBD Clear Emission Related Diagnostic Information service. Clears emission-related diagnostic trouble codes (DTCs) in the ECU.

Format
long ndOBDClearEmissionRelatedDiagnosticInformation(
    TD1 *diagRef,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

Output
success
Indicates successful receipt of a positive response message for this diagnostic service.

Return Value
The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
ndOBDRequestControlOfOnBoardDevice

Purpose
Executes the OBD Request Control Of On-Board Device service. Modifies ECU I/O port behavior.

Format
long ndOBDRequestControlOfOnBoardDevice(
   TD1 *diagRef,
   unsigned char TID,
   unsigned char dataIn[],
   long len,
   unsigned char dataOut[],
   long *len2,
   LVBoolean *success);

Input
diagRef
   Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

TID
   Defines the test identifier of the I/O to be manipulated. The values are application specific.

dataIn
   Defines application-specific data for this service.

len
   Must contain the number of valid data bytes in dataIn.

Output
dataOut
   Returns application-specific data for this service.

len2
   On input, len2 must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success
   Indicates successful receipt of a positive response message for this diagnostic service.
Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
**ndOBDRequestCurrentPowertrainDiagnosticData**

**Purpose**
Executes the OBD Request Current Powertrain Diagnostic Data service. Reads an ECU data record.

**Format**
```
long ndOBDRequestCurrentPowertrainDiagnosticData(
    TD1 *diagRef,
    unsigned char PID,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.
- **PID**
  Defines the parameter identifier of the data to be read. The SAE J1979 standard defines the values.

**Output**
- **dataOut**
  Returns the ECU data record. If you know the record data description, use `ndConvertToPhys` to interpret this record. You can obtain the description from the SAE J1979 standard.
- **len**
  On input, `len` must contain the `dataOut` array length. On return, it contains the number of valid data bytes in the `dataOut` array.
- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.
Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the ndStatusToString function to obtain a descriptive string for the return value.
**ndOBDRequestEmissionRelatedDTCs**

**Purpose**
Executes the OBD Request Emission Related DTCs service. Reads all emission-related Diagnostic Trouble Codes (DTCs).

**Format**

```c
long ndOBDRequestEmissionRelatedDTCs(
    TD1 *diagRef,
    TD3 *DTCDescriptor,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);
```

**Input**

- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **DTCDescriptor**
  A struct that describes the DTC records the ECU delivers:

  ```c
typedef struct {
    long DTCByteLength;
    long StatusByteLength;
    long AddDataByteLength;
    unsigned short ByteOrder;
  } TD3;
```

  - **DTCByteLength** indicates the number of bytes the ECU sends for each DTC. The default is 2.
  - **StatusByteLength** indicates the number of bytes the ECU sends for each DTC’s status. The default is 0 for OBD.
  - **AddDataByteLength** indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there are no additional data, so the default is 0.
  - **ByteOrder** indicates the byte ordering for multibyte items:
    - 0: MSB_FIRST (Motorola), default
    - 1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs struct array.
Output

DTCs

Returns the resulting DTCs as an array of structs:

```c
typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;
```

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use `ndDTCToString` to convert this code to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

For OBD, this field usually does not contain valid information.

AddData contains optional additional data for this DTC. Usually, this does not contain valid information (refer to `DTCDescriptor`).

len

On input, len must contain the DTCs array length in elements. On return, it contains the number of valid elements in the DTCs array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
ndOBDRequestEmissionRelatedDTCsDuringCurrentDriveCycle

Purpose
Executes the OBD Request Emission Related DTCs During Current Drive Cycle service. Reads the emission-related Diagnostic Trouble Codes (DTCs) that occurred during the current (or last completed) drive cycle.

Format
```
long ndOBDRequestEmissionRelatedDTCsDuringCurrentDriveCycle(
    TD1 *diagRef,
    TD3 *DTCDescriptor,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);
```

Input
diagRef
Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

DTCDescriptor
A struct that describes the DTC records the ECU delivers:
```
typedef struct {
    long DTCByteLength;
    long StatusByteLength;
    long AddDataByteLength;
    unsigned short ByteOrder;
} TD3;
```

DTCByteLength indicates the number of bytes the ECU sends for each DTC. The default is 2.

StatusByteLength indicates the number of bytes the ECU sends for each DTC’s status. The default is 0 for OBD.

AddDataByteLength indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there are no additional data, so the default is 0.

ByteOrder indicates the byte ordering for multibyte items:
0: MSB_FIRST (Motorola), default
1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs struct array.
Output

DTCs

Returns the resulting DTCs as an array of structs:

```c
typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;
```

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use `ndDTCToString` to convert this code to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

For OBD, this field usually does not contain valid information.

AddData contains optional additional data for this DTC. Usually, this does not contain valid information (refer to `DTCDescriptor`).

len

On input, `len` must contain the `DTCs` array length in elements. On return, it contains the number of valid elements in the `DTCs` array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
ndOBDRequestOnBoardMonitoringTestResults

Purpose
Executes the OBD Request On-Board Monitoring Test Results service. Reads an ECU test data record.

Format
long ndOBDRequestOnBoardMonitoringTestResults(
    TD1 *diagRef,
    unsigned char OBDMID,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);

Input
diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

OBDMID
Defines the parameter identifier of the data to be read. The SAE J1979 standard defines the values.

Output
dataOut
Returns the ECU test data record. If you know the record data description, use ndConvertToPhys to interpret this record. You can obtain the description from the SAE J1979 standard.

len
On input, len must contain the dataOut array length. On return, it contains the number of valid data bytes in the dataOut array.

success
Indicates successful receipt of a positive response message for this diagnostic service.
Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
ndOBDRequestPermanentFaultCodes

Purpose
Executes the OBD Request Permanent Fault Codes service. All permanent Diagnostic Trouble Codes (DTCs) are read.

Format
long ndOBDRequestPermanentFaultCodes(
    TD1 *diagRef,
    TD3 *DTCDescriptor,
    TD4 DTCs[],
    long *len,
    LVBoolean *success);

Input

diagRef
Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

DTCDescriptor
A struct that describes the DTC records the ECU delivers:

    typedef struct {
        long DTCByteLength;
        long StatusByteLength;
        long AddDataByteLength;
        unsigned short ByteOrder;
    } TD3;

DTCByteLength indicates the number of bytes the ECU sends for each DTC. The default is 2.
StatusByteLength indicates the number of bytes the ECU sends for each DTC’s status. The default is 0 for OBD.
AddDataByteLength indicates the number of bytes the ECU sends for each DTC’s additional data. Usually, there are no additional data, so the default is 0.
ByteOrder indicates the byte ordering for multibyte items:
    0: MSB_FIRST (Motorola), default
    1: LSB_FIRST (Intel)

This function interprets the response byte stream according to this description and returns the resulting DTC records in the DTCs struct array.
Output

DTCs

Returns the resulting DTCs as an array of structs:

```c
typedef struct {
    unsigned long DTC;
    unsigned long Status;
    unsigned long AddData;
} TD4;
```

DTC is the resulting Diagnostic Trouble Code. For the default 2-byte DTCs, use `ndDTCToString` to convert this code to readable format as defined by SAE J2012.

Status is the DTC status. Usually, this is a bit field with following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>testFailed</td>
</tr>
<tr>
<td>1</td>
<td>testFailedThisMonitoringCycle</td>
</tr>
<tr>
<td>2</td>
<td>pendingDTC</td>
</tr>
<tr>
<td>3</td>
<td>confirmedDTC</td>
</tr>
<tr>
<td>4</td>
<td>testNotCompletedSinceLastClear</td>
</tr>
<tr>
<td>5</td>
<td>testFailedSinceLastClear</td>
</tr>
<tr>
<td>6</td>
<td>testNotCompletedThisMonitoringCycle</td>
</tr>
<tr>
<td>7</td>
<td>warningIndicatorRequested</td>
</tr>
</tbody>
</table>

For OBD, this field usually does not contain valid information.

AddData contains optional additional data for this DTC. Usually, this does not contain valid information (refer to `DTCDescriptor`).

len

On input, len must contain the DTCs array length in elements. On return, it contains the number of valid elements in the DTCs array.

success

Indicates successful receipt of a positive response message for this diagnostic service.

Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
**ndOBDRequestPowertrainFreezeFrameData**

**Purpose**
Executes the OBD Request Powertrain Freeze Frame Data service. Reads an ECU data record stored while a diagnostic trouble code occurred.

**Format**
```c
long ndOBDRequestPowertrainFreezeFrameData(
    TD1 *diagRef,
    unsigned char PID,
    unsigned char nFrame,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);
```

**Input**
- **diagRef**
  Specifies the diagnostic session handle, obtained from `ndOpenDiagnostic` or `ndOpenDiagnosticOnIP` and passed to subsequent diagnostic functions. Normally, it is not necessary to manually manipulate the elements of this struct.

- **PID**
  Defines the parameter identifier of the data to be read. The SAE J1979 standard defines the values.

- **nFrame**
  The number of the freeze frame from which the data are to be retrieved.

**Output**
- **dataOut**
  Returns the ECU data record. If you know the record data description, use `ndConvertToPhys` to interpret this record. You can obtain the description from the SAE J1979 standard.

- **len**
  On input, `len` must contain the `dataOut` array length. On return, it contains the number of valid data bytes in the `dataOut` array.

- **success**
  Indicates successful receipt of a positive response message for this diagnostic service.
Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
ndOBDRequestVehicleInformation

Purpose
Executes the OBD Request Vehicle Information service. Reads a set of information data from
the ECU.

Format
long ndOBDRequestVehicleInformation(
    TD1 *diagRef,
    unsigned char infoType,
    unsigned char *nItems,
    unsigned char dataOut[],
    long *len,
    LVBoolean *success);

Input
diagRef
    Specifies the diagnostic session handle, obtained from ndOpenDiagnostic or
    ndOpenDiagnosticOnIP and passed to subsequent diagnostic functions. Normally, it
    is not necessary to manually manipulate the elements of this struct.

infoType
    Defines the type of information to be read. The SAE J1979 standard defines the values.

Output
nItems
    The number of data items (not bytes) this service returns.

dataOut
    Returns the ECU vehicle information. You can obtain the description from the
    SAE J1979 standard.

len
    On input, len must contain the dataOut array length. On return, it contains the number
    of valid data bytes in the dataOut array.

success
    Indicates successful receipt of a positive response message for this diagnostic service.
Return Value

The return value indicates the function call status as a signed 32-bit integer. Zero means the function executed successfully. A negative value specifies an error, which means the function did not perform the expected behavior. A positive value specifies a warning, which means the function performed as expected, but a condition arose that may require attention.

Use the `ndStatusToString` function to obtain a descriptive string for the return value.
Visit the following sections of the award-winning National Instruments Web site at ni.com for technical support and professional services:

- **Support**—Technical support at ni.com/support includes the following resources:
  - **Self-Help Technical Resources**—For answers and solutions, visit ni.com/support for software drivers and updates, a searchable KnowledgeBase, product manuals, step-by-step troubleshooting wizards, thousands of example programs, tutorials, application notes, instrument drivers, and so on. Registered users also receive access to the NI Discussion Forums at ni.com/forums. NI Applications Engineers make sure every question submitted online receives an answer.
  - **Standard Service Program Membership**—This program entitles members to direct access to NI Applications Engineers via phone and email for one-to-one technical support, as well as exclusive access to eLearning training modules at ni.com/eLearning. NI offers complementary membership for a full year after purchase, after which you may renew to continue your benefits.

For information about other technical support options in your area, visit ni.com/services, or contact your local office at ni.com/contact.

- **Training and Certification**—Visit ni.com/training for training and certification program information. You can also register for instructor-led, hands-on courses at locations around the world.

- **System Integration**—If you have time constraints, limited in-house technical resources, or other project challenges, National Instruments Alliance Partner members can help. To learn more, call your local NI office or visit ni.com/alliance.

You also can visit the Worldwide Offices section of ni.com/niglobal to access the branch office Web sites, which provide up-to-date contact information, support phone numbers, email addresses, and current events.
