Important Information

**Warranty**

NI 177x Smart Cameras are warranted against defects in materials and workmanship for a period of one year from the date of shipment, as evidenced by receipts or other documentation. National Instruments will, at its option, repair or replace equipment that proves to be defective during the warranty period. This warranty includes parts and labor.

The media on which you receive National Instruments software are warranted not to fail to execute programming instructions, due to defects in materials and workmanship, for a period of 90 days from date of shipment, as evidenced by receipts or other documentation. National Instruments will, at its option, repair or replace software media that do not execute programming instructions if National Instruments receives notice of such defects during the warranty period. National Instruments does not warrant that the operation of the software shall be uninterrupted or error free.

A Return Material Authorization (RMA) number must be obtained from the factory and clearly marked on the outside of the package before any equipment will be accepted for warranty work. National Instruments will pay the shipping costs of returning to the owner parts which are covered by warranty.

National Instruments believes that the information in this document is accurate. The document has been carefully reviewed for technical accuracy. In the event that technical or typographical errors exist, National Instruments reserves the right to make changes to subsequent editions of this document without prior notice to holders of this edition. The reader should consult National Instruments if errors are suspected. In no event shall National Instruments be liable for any damages arising out of or related to this document or the information contained in it.

Except as specified herein, National Instruments makes no warranties, express or implied, and specifically disclaims any warranty of merchantability or suitability for a particular purpose. Customer’s removal or use of components or software of National Instruments shall be limited to the amount therefore paid by the customer. National Instruments will not be liable for damages resulting from loss of data, profits, use of products, or incidental or consequential damages, even if advised of the possibility thereof. This limitation of the liability of National Instruments will apply regardless of the form of action, whether in contract or tort, including negligence. Any action against National Instruments must be brought within one year after the cause of action accrues. National Instruments shall not be liable for any delay in performance due to causes beyond its reasonable control. The warranty provided herein does not cover damages, defects, malfunctions, or service failures caused by owner’s failure to follow the National Instruments installation, operation, or maintenance instructions; owner’s modification of the product; owner’s abuse, misuse, or negligent acts; and power failure or surges, fire, flood, accident, actions of third parties, or other events outside reasonable control.

**Copyright**

Under the copyright laws, this publication may not be reproduced or transmitted in any form, electronic or mechanical, including photocopying, recording, storing in an information retrieval system, or translating, in whole or in part, without the prior written consent of National Instruments Corporation.

National Instruments respects the intellectual property of others, and we ask our users to do the same. NI software is protected by copyright and other intellectual property laws. Where NI software may be used to reproduce software or other materials belonging to others, you may use NI software only to reproduce materials that you may reproduce in accordance with the terms of any applicable license or other legal restriction.

**Trademarks**

LabVIEW, National Instruments, NI, ni.com, the National Instruments corporate logo, and the Eagle logo are trademarks of National Instruments Corporation. Refer to the Trademark Information at ni.com/trademarks for other National Instruments trademarks.

Other product and company names mentioned herein are trademarks or trade names of their respective companies.

Members of the National Instruments Alliance Partner Program are business entities independent from National Instruments and have no agency, partnership, or joint-venture relationship with National Instruments.

**Patents**

For patents covering National Instruments products/technology, refer to the appropriate location: Help-Patents in your software, the patents.txt file on your media, or the National Instruments Patent Notice at ni.com/patents.

**Export Compliance Information**

Refer to the Export Compliance Information at ni.com/legal/export-compliance for the National Instruments global trade compliance policy and how to obtain relevant IT S codes, ECCNs, and other import/export data.

**WARNING REGARDING USE OF NATIONAL INSTRUMENTS PRODUCTS**

1. National Instruments Products are not designed with components and testing for a level of reliability suitable for use in or in connection with surgical implants or as critical components in any life support systems whose failure to perform can reasonably be expected to cause significant injury to a human.

2. In any application, including the above, reliability of operation of the software products can be impaired by adverse factors, including but not limited to fluctuations in electrical power supply, computer hardware malfunctions, computer operating system software, fitness, fitness of compilers and development software used to develop an application, installation errors, software and hardware compatibility problems, malfunctions or failures of electronic monitoring or control devices, transient failures of electronic systems (hardware and/or software), unanticipated uses or misuses, or errors on the part of the user or applications designer (adverse factors such as these are hereafter collectively termed “system failures”). Any application where a system failure would create a risk of harm to property or persons (including the risk of bodily injury and death) should not be reliant solely upon one form of electronic system due to the risk of system failure. To avoid damage, injury, or death, the user or application designer must take reasonably steps to protect against system failures, including but not limited to back-up or shut down mechanisms. Because each end-user system is customized and differs from National Instruments testing platforms and because a user or application designer may use National Instruments products in combination with other products in a manner not evaluated or contemplated by National Instruments, the user or application designer is ultimately responsible for verifying and validating the suitability of National Instruments products whenever National Instruments products are incorporated in a system or application, including, without limitation, the appropriate design, process and safety level of such system or application.
Compliance

Electromagnetic Compatibility Information

This product was tested and complies with the regulatory requirements and limits for electromagnetic compatibility (EMC) as stated in the product specifications. These requirements and limits are designed to provide reasonable protection against harmful interference when the product is operated in its intended operational electromagnetic environment.

This product is intended for use in industrial locations. There is no guarantee that harmful interference will not occur in a particular installation, when the product is connected to a test object, or if the product is used in residential areas. To minimize the potential for the product to cause interference to radio and television reception or to experience unacceptable performance degradation, install and use this product in strict accordance with the instructions in the product documentation.

Furthermore, any changes or modifications to the product not expressly approved by National Instruments could void your authority to operate it under your local regulatory rules.

About This Manual

This manual contains detailed installation instructions and electrical and mechanical information for the National Instruments 177x Smart Camera.

Conventions

The following conventions appear in this manual:

»

The » symbol leads you through nested menu items and dialog box options to a final action. The sequence **Options**»**Settings**»**General** directs you to pull down the **Options** menu, select the **Settings** item, and select **General** from the last dialog box.

⚠️

This icon denotes a note, which alerts you to important information.

⚠️

This icon denotes a caution, which advises you of precautions to take to avoid injury, data loss, or a system crash.

⚠️

When this symbol is marked on a product, it denotes a warning advising you to take precautions to avoid electrical shock.

**bold**

Bold text denotes items that you must select or click in the software, such as menu items and dialog box options. Bold text also denotes parameter names.

**italic**

Italic text denotes variables, emphasis, a cross-reference, or an introduction to a key concept. Italic text also denotes text that is a placeholder for a word or value that you must supply.

**monospace**

Text in this font denotes text or characters that you should enter from the keyboard, sections of code, programming examples, and syntax examples. This font is also used for the proper names of disk drives, paths, directories, programs, subprograms, subroutines, device names, functions, operations, variables, filenames, and extensions.

**monospace italic**

Italic text in this font denotes text that is a placeholder for a word or value that you must supply.
Related Documentation

The following documents contain information that you may find helpful as you read this manual:

Hardware Documents

- **NI 177x Series Smart Camera: Using the NI Smart Camera with LabVIEW**—Contains basic installation and configuration instructions for using the NI Smart Camera with LabVIEW.
- **NI 177x Series Smart Camera: Using the NI Smart Camera with Vision Builder AI**—Contains basic installation and configuration instructions for using the NI Smart Camera with Vision Builder AI.
- **Power and I/O Accessory for NI 177x Smart Cameras User Guide**—Contains installation and operation instructions, and feature descriptions for the power and I/O accessory (781993-01).
- **NI Developer Zone**—Contains example programs, tutorials, technical presentations, the Instrument Driver Network, a measurement glossary, an online magazine, a product advisor, and a community area where you can share ideas, questions, and source code with developers around the world. The NI Developer Zone is located on the National Instruments Web site at [ni.com/zone](http://ni.com/zone).

NI Vision Builder for Automated Inspection Documents

- **NI Vision Builder for Automated Inspection Tutorial**—Describes Vision Builder for Automated Inspection and provides step-by-step instructions for solving common visual inspection tasks, such as inspection, gauging, part presence, guidance, and counting.
- **NI Vision Builder for Automated Inspection: Configuration Help**—Contains information about using the Vision Builder for Automated Inspection Configuration Interface to create a machine vision application.
- **NI Vision Builder for Automated Inspection: Inspection Help**—Contains information about running applications created with Vision Builder for Automated Inspection in the Vision Builder Automated Inspection Interface.
LabVIEW and NI Vision Development Module Documents

- **LabVIEW Help**—Includes information about LabVIEW programming concepts, step-by-step instructions for using LabVIEW, and reference information about LabVIEW VIs, functions, palettes, menus, and tools.

- **Getting Started with LabVIEW**—Use this manual as a tutorial to familiarize yourself with the LabVIEW graphical programming environment and the basic LabVIEW features you use to build data acquisition and instrument control applications.

- **Getting Started with the LabVIEW Real-Time Module**—Use this manual as a tutorial to familiarize yourself with the LabVIEW Real-Time Module and the basic Real-Time Module features you use to build real-time applications.

- **NI Vision Concepts Help**—Describes the basic concepts of image analysis, image processing, and machine vision. This document also contains in-depth discussions about imaging functions for advanced users.

- **NI Vision for LabVIEW Help**—Describes how to create machine vision and image processing applications in LabVIEW using the Vision Development Module. The help file guides you through tasks beginning with setting up your imaging system to taking measurements. It also describes how to create a real-time vision application using NI Vision with the LabVIEW Real-Time Module and contains reference information about NI Vision for LabVIEW palettes and VIs.

NI Vision Acquisition Software Documents

- **NI-IMAQdx VI Reference Help**—Contains reference information about the LabVIEW VIs and properties for NI-IMAQdx driver software.

- **Measurement & Automation Explorer Help for NI-IMAQdx**—Describes how to configure NI-IMAQdx driver software, NI image acquisition devices, and NI Smart Cameras using Measurement & Automation Explorer.
Part I

Getting Started with the NI 177x Smart Camera

This section provides the following information:

• Basic information about the NI 177x Smart Camera hardware
• Instructions for configuring the NI 177x Smart Camera hardware
• Basic information about software options for application development
• Instructions for acquiring your first image with the NI 177x Smart Camera using the selected application development software
This chapter provides an overview of the features and components of the NI 177x Smart Camera. Figure 1-1 shows the NI 177x Smart Camera.
Hardware Overview

NI 177x Smart Cameras incorporate an Intel® Atom™ Z530 (1.60 GHz) processor, image sensor, and digital I/O M12 connectors in a compact, rugged, IP67 rated housing. Refer to the I/O Connector section of Chapter 3, Connectors, for more information about the digital I/O capabilities of the device.

NI 177x Smart Cameras are available with the following image sensor configurations.

Table 1-1. NI 177x Smart Camera Models

<table>
<thead>
<tr>
<th>Model</th>
<th>Resolution</th>
<th>Color Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>NI 1772</td>

<td>Yes</td>
</tr>
</tbody>
</table>

For more information about the image sensors, refer to Chapter 5, Image Sensor. For complete device specifications, refer to Appendix A, Specifications.

NI 177x Smart Cameras use a standard C-mount lens, and include 4 opto-coupled inputs, 4 open collector outputs, an optically isolated trigger input, and a constant current output for connecting to external devices. For complete device specifications, refer to Appendix A, Specifications.

NI 177x Smart Cameras includes 4 LED indicators for communicating system status. Refer to Chapter 7, LED Indicators, for more information about the LED indicators.
Connect the Power Supply and I/O

National Instruments provides the following two cable options for connecting a power supply (782032-01) and I/O to the NI 177x Smart Camera.

- **Power and I/O Accessory (781993-01)**—A terminal block that simplifies power and I/O signal configuration for the NI 177x Smart Camera. The accessory uses a 25-pin D-SUB connector and a 17-pin M12 to 25-pin D-SUB cable.

- **17-pin M12 Pigtail Cable (153131-03)**—An open-ended cable that you can use to create your own custom cable. Refer to the *I/O Connector* section of Chapter 3, *Connectors* for wiring information.

⚠️ **Caution**  Use the NI 177x Smart Camera only with a 12 W, 24 VDC ±10%, UL listed, limited power source (LPS) supply. The power supply will bear the UL listed mark, LPS. The power supply must also meet any safety and compliance requirements for the country of use.

To connect a power supply to the NI 177x Smart Camera using the Power and I/O Accessory for NI 177x Smart Cameras, refer to Figure 1-2 and complete the following steps.
Figure 1-2. Connecting the NI 177x Smart Camera to the Power and I/O Accessory

1. Connect and secure the 17-pin M12 connector on the I/O cable to the I/O connector on the NI 177x Smart Camera.
2. Connect and secure the 25-pin D-SUB connector on the I/O cable to the CAMERA connector on the terminal block.
3. Connect the power supply output to the 24 V in connector on the terminal block.
4. Connect any additional I/O signals necessary for your application to the appropriate terminal block connector. Refer to the I/O Connector section of Chapter 3, Connectors, for pin information.
5. Plug the power supply into an outlet.

When power is first applied to the device, the Power and Status LED indicators flash red once while internal systems power up. The Power LED then lights green if power is wired correctly.
Connect to the Development Computer

The NI 177x Smart Camera can connect to the development computer directly or through a network. To configure the NI 177x Smart Camera through a network, the NI 177x Smart Camera and the development computer must be connected to the same subnet.

⚠️ Caution ⚠️ To prevent data loss and to maintain the integrity of your Ethernet installation, do not use a cable longer than 100 m. National Instruments recommends using a shielded twisted pair cable for maximum signal integrity.

Direct Connection

To connect the NI 177x Smart Camera directly to the development computer, complete the following steps.

1. Connect the 8-pin female M12 connector to the 100/1G connector on the NI 177x Smart Camera.
2. Connect the Ethernet connector to an Ethernet port on the development computer.

The NI 177x Smart Camera is now connected directly to the development computer.

Network Connection

To connect the NI 177x Smart Camera to the development computer through a network, complete the following steps.

1. Verify that the development computer is connected to the network and powered on.
2. Connect the 8-pin female M12 connector to the 100/1G connector on the NI 177x Smart Camera.
3. Connect the Ethernet connector to an Ethernet port.

The NI 177x Smart Camera is now connected through a network and is available for additional configuration with the development computer.
Subnet Considerations

To use the NI 177x Smart Camera on a subnet other than the one on which the development computer resides, first connect and configure the NI 177x Smart Camera on the same subnet as the development computer. Next, physically move the NI 177x Smart Camera. Contact your network administrator for assistance in determining which network ports reside on the same subnet.

IP Address Assignment

If the NI 177x Smart Camera is connected directly to the development computer, the device will use a link-local IP address. If the NI 177x Smart Camera is connected to a network that has a DHCP server, the device will automatically obtain an IP address. You can also configure the NI 177x Smart Camera to use a static IP address. If you cannot locate the NI 177x Smart Camera on the network, first refer to the Firewall Configuration section, then assign a static IP address or contact your network administrator.

**Note** If the NI 177x Smart Camera IP address is 169.254.x.x, the device is only accessible from the local subnet. To access the smart camera from a remote subnet, configure the smart camera to obtain an IP address from a DHCP server or manually assign a static IP address.

DHCP IP Addresses

Using a DHCP server to assign an IP address has the following advantages:

- The DHCP server manages the IP addresses of the network. You do not need to know the IP address of the NI 177x Smart Camera.
- The DHCP server does not allow other devices to use the IP address that is already assigned to your NI 177x Smart Camera.

Although using a DHCP server simplifies IP address configuration, using a static IP address can be more reliable. Consider the following potential issues before using a DHCP server to assign an IP address to the NI 177x Smart Camera:

- If the network has both static IP addresses and IP addresses managed by a DHCP server, the DHCP server must be configured to not use reserved static IP addresses. If the DHCP server is not configured this way, the DHCP server can assign a reserved IP address to another device, causing address conflicts on the network, which results in some devices being unreachable.
When a NI 177x Smart Camera configured for DHCP starts, it must be able to connect to the DHCP server. If the NI 177x Smart Camera cannot connect to the DHCP server and is not connected to the same subnet as the development computer, it does not appear in MAX or Vision Builder AI.

**Note** A NI 177x Smart Camera connected directly to the development computer or to the same subnet as the development computer is always configurable from MAX or Vision Builder AI, regardless of the IP address settings.

### Firewall Configuration

If you are having difficulty detecting the NI 177x Smart Camera on your network, you must configure the firewall to open the TCP/UDP ports used by the NI 177x Smart Camera and the host machine. The required ports are listed in Table 1-2.

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>3580</td>
<td>TCP/UDP</td>
<td>Reserved as nati-svrloc (NAT-ServiceLocator). Used by Measurement &amp; Automation Explorer (MAX) to locate remote targets.</td>
</tr>
<tr>
<td>7749</td>
<td>TCP</td>
<td>Used for remote image display (not reserved).</td>
</tr>
<tr>
<td>7750</td>
<td>TCP</td>
<td>Used for NI-IMAQdx remote configuration (not reserved).</td>
</tr>
<tr>
<td>3363</td>
<td>TCP/UDP</td>
<td>Reserved as nati-vi-server (NATI VI Server). Used by Vision Builder for Automated Inspection to configure a remote NI Smart Camera.</td>
</tr>
</tbody>
</table>

If your firewall is controlled remotely or you are unsure about configuring the firewall, contact your network administrator.
Software Overview

National Instruments provides two options for developing applications for the NI 177x Smart Camera.

Note  Vision Builder for Automated Inspection and NI Vision Acquisition Software are included with the NI 177x Smart Camera. LabVIEW, the LabVIEW Real-Time Module, and the NI Vision Development Module are sold separately.

The following sections describe the installation and configuration process for each development environment:

- Refer to Configuring the NI Smart Camera with Vision Builder AI for information about using the NI 177x Smart Camera with Vision Builder AI.
- Refer to Configuring the NI Smart Camera with LabVIEW for information about using the NI 177x Smart Camera with LabVIEW.

The installation and configuration process for each development environment is different. Complete only the instructions for your chosen development environment.

Caution  National Instruments software may require you to update the firmware for this device. Do not remove power from the device until the software indicates that the firmware update is complete. Removing power during a firmware update could cause your device to become unusable.
Configuring the NI Smart Camera with Vision Builder AI

Vision Builder AI is interactive, menu-driven configuration software for developing, benchmarking, and deploying machine vision applications. With Vision Builder AI, you can perform powerful visual inspection tasks and make decisions based on the results of individual tasks. You can also migrate your inspection to LabVIEW to extend the capabilities of your application, if necessary. The latest version of Vision Builder AI is included with the NI 177x Smart Camera.

Complete the following steps to install Vision Builder AI and configure the NI 177x Smart Camera.

1. Install and activate Vision Builder AI on the development computer. Refer to the NI Vision Builder for Automated Inspection Readme for installation instructions.

2. Launch Vision Builder AI.

3. On the Vision Builder AI welcome screen, select the NI 177x Smart Camera in the list of targets. If the NI 177x Smart Camera does not appear in the list of targets, verify that the device has power and is connected to an Ethernet port on the same subnet as the development computer, then click Refresh Target List. Refer to Chapter 7, LED Indicators for information about LED status messages.

4. Click Install Software. The Remote Target Configuration Wizard launches in a new window.

5. In the Name field, enter a name for the device. Use the Description field to enter any additional information or a brief description of the device. Device names are limited to 31 characters with no spaces or special characters, except hyphens. The first and last characters must be alphanumeric.

6. Click Next.

Configure the IP Address

Complete the following steps to configure IP address settings for the NI 177x Smart Camera in the The Remote Target Configuration Wizard.

1. If the network is configured to issue IP addresses using DHCP, select Obtain IP address from DHCP server. Otherwise, configure the IP address manually by selecting Edit the IP settings and clicking Suggest Values.
2. If you want to prevent other users from configuring the device, select **Enable Password** and click **Set Password** to set up password protection.

3. Click **Next**.

### Install Software on the NI Smart Camera

Complete the following steps to install software from the development computer to the NI 177x Smart Camera.

1. In the Remote Target Configuration Wizard, enable the **Update Target Software** checkbox.
2. Click the **Browse** button next to the **Software Image to Install on the Target** control.
3. Navigate to the Vision Builder AI software image you want to use, and click **OK**. Software images provided by National Instruments are installed to the `<Vision Builder AI>\RT Images` directory, where `<Vision Builder AI>` is the location where Vision Builder AI is installed.
4. Click **OK** to apply the IP configuration settings and download software to the device.
5. Click **OK** to close the Remote Target Configuration Successful dialog box.

### Acquire an Image with Vision Builder AI

Complete the following steps to acquire an image using Vision Builder AI.

1. On the Vision Builder AI welcome screen, select the NI 177x Smart Camera in the list of targets.
2. Click **Acquire Image (Smart Camera) Example**. The image acquisition example opens in the Vision Builder AI Configuration Interface.
3. Click the **Run Inspection Once** button to acquire a single image.
4. In the State Configuration Window, select the **Acquire Image (Smart Camera)** step.
5. Click the **Edit Step** button. The property page for the step opens.
6. Use the controls on the **Main, Color, Trigger, Lighting**, or **Advanced** tabs to configure additional settings for your application.
7. Click **OK** to save the step configuration.
The NI 177x Smart Camera is now configured and acquiring images. Use Vision Builder AI to add and configure additional inspection steps to create your application. Refer to the Related Documentation section in the introduction to this manual for a list of documentation and other resources to help you set up and use the NI 177x Smart Camera in an application.

Configuring the NI Smart Camera with LabVIEW

LabVIEW is a graphical programming environment for developing flexible and scalable applications. The following add-on modules are required for developing machine vision applications:

- **LabVIEW Real-Time Module**—Programming library for developing distributed, deterministic applications.
- **NI Vision Development Module**—Programming library for developing machine vision and scientific imaging applications.
- **NI Vision Acquisition Software**—Includes Measurement & Automation Explorer (MAX), the National Instruments configuration utility, and NI-IMAQdx driver software for acquiring images and controlling I/O using the NI 177x Smart Camera. The latest version of NI Vision Acquisition software is included with the NI 177x Smart Camera.

Install the software in the following order:

1. **LabVIEW**—Refer to the LabVIEW Release Notes for installation instructions for LabVIEW and system requirements for the LabVIEW software. Refer to the LabVIEW Upgrade Notes for additional information about upgrading to the most recent version of LabVIEW.

   Documentation for LabVIEW is available by selecting Start » All Programs » National Instruments » LabVIEW » LabVIEW Manuals.

2. **LabVIEW Real-Time Module**—Refer to the LabVIEW Real-Time Module Release and Upgrade Notes for installation instructions and information about getting started with the LabVIEW Real-Time Module.

   Documentation for the LabVIEW Real-Time Module is available by selecting Start » All Programs » National Instruments » LabVIEW » LabVIEW Manuals.

3. **NI-IMAQdx**—Refer to the NI Vision Acquisition Software Release Notes on the NI Vision Acquisition Software installation media for system requirements and installation instructions for the NI-IMAQdx driver.
Chapter 2  Software Overview

Documentation for the NI-IMAQdx driver software is available by selecting Start»All Programs»National Instruments»Vision» Documentation»NI-IMAQdx.

4. **NI Vision Development Module**—Refer to the *NI Vision Development Module Readme* on the NI Vision Development Module installation media for system requirements and installation instructions.

   Documentation for the NI Vision Development Module is available by selecting Start»All Programs»National Instruments»Vision» Documentation»NI Vision.

**Configure the IP Address**

Complete the following steps to configure IP address settings for the NI 177x Smart Camera in MAX:

1. Launch MAX by double-clicking the Measurement & Automation icon on the desktop, or selecting Start»All Programs»National Instruments»Measurement & Automation.

2. Expand the **Remote Systems** branch of the configuration tree, and select the device you want to configure. To uniquely identify multiple unconfigured devices, connect and configure one device at a time.

   If the NI 177x Smart Camera does not appear in the list of targets, verify that the device has power and is connected to an Ethernet port on the same subnet as the development computer. Refer to Chapter 7, *LED Indicators* for information about LED status messages.

3. In the **Name** field, enter a name for the device. Use the **Comment** field to enter any additional information or a brief description of the device.

4. Device names are limited to 31 characters with no spaces or special characters, except hyphens. The first and last characters must be alphanumeric.

5. Verify the IP address configuration.
   - If the network is configured to issue IP addresses using DHCP, select **Obtain IP address from DHCP server**.
   - Otherwise, configure the IP address manually. Select **Edit the IP settings**, click **Suggest Values**, and click **OK**.

   **Note**  If the IP address is 169.254.x.x or 0.0.0.0, the device is only accessible from the local subnet. To access the device from a remote subnet, configure the device to obtain an IP address from a DHCP server or manually assign a static IP address.
Chapter 2  Software Overview

6. If you want to prevent other users from resetting the NI 177x Smart Camera, click the Lock button on the MAX toolbar to set up password protection. To require users to enter the password before restarting the device, enable the Password-protect Resets checkbox.

7. Click Apply on the MAX toolbar.

8. When prompted, click Yes to restart the NI 177x Smart Camera. The initialization process may take several minutes.

Install Software on the NI Smart Camera

Complete the following steps to install software from the development computer to the NI 177x Smart Camera.

1. In the Remote Systems branch of the MAX configuration tree, expand the folder for your device and select Software.

2. Click Add/Remove Software on the MAX toolbar to launch the LabVIEW Real-Time Software Wizard.

3. Select NI Vision RT and NI-IMAQdx RT. The software wizard will automatically select any other required software.

4. Click Next.

5. Verify your software installation choices, and click Next.

6. When the installation is complete, click Finish.

Acquire an Image

Complete the following steps to acquire an image using MAX.

1. In the Remote Systems branch of the MAX configuration tree, expand the folder for your device.

2. Click cam0:NI 177x, where 177x is replaced by the actual model number of your NI 177x Smart Camera.

3. Click Snap to acquire a single image, or click Grab to acquire continuous images. Click Grab again to stop a continuous acquisition.

4. Use the controls on the Sensor, Color, Triggering, Lighting, and Camera Attributes tabs to adjust the acquisition settings.

The NI Smart Camera is now configured and acquiring images. Use LabVIEW to create your application. Refer to the Related Documentation section in the introduction to this manual for a list of documentation and other resources to help you set up and use the NI 177x Smart Camera in an application.
This section provides the following information:

- Descriptions and pinout information for the M12 connectors
- Wiring diagrams and instructions for connecting the NI 177x Smart Camera to external devices
- Information about acquiring an image with the NI 177x Smart Camera
- Descriptions and blink code explanations for the LED indicators
- Information about mounting the NI 177x Smart Camera
Connectors

This chapter provides information about the NI 177x Smart Camera connectors, including pin numbers and signal names.

Figure 3-1 shows the NI 177x Smart Camera connectors.

The following table lists the connectors found on the NI 177x Smart Camera:

<table>
<thead>
<tr>
<th>Connector Name</th>
<th>Connector Type</th>
<th>Description</th>
</tr>
</thead>

</table>
Chapter 3  Connectors

I/O Connector

The I/O connector is a 17-pin male M12 connector that provides power to the camera and transmits digital I/O signals.

The I/O connector includes 4 open collector output connections, including 2 output connections which can be used as strobe signals. An open collector output is not capable of providing voltage to a connected device. Instead, power is provided by the connected device and is either grounded or not grounded by the open collector connection. Each connection is protected by a 100 mA fuse. The I/O connector also includes a controlled current output capable of providing current to a LED light.

The I/O connector includes 4 independent opto-coupled input connections, which share a common ground connection with the NI 177x Smart Camera. Each input can be configured to generate interrupts and reject signals that are shorter than a specified width. The I/O connector also includes an optically isolated trigger input.
The following table lists pin numbers, signal names, and signal descriptions for the I/O connector.

**Table 3-2. I/O Connector Signals**

NI Smart Camera Power Requirements

**Caution**  Use the NI 177x Smart Camera only with a 12 W, 24 VDC ±10%, UL listed, limited power source (LPS) supply. The power supply should bear the UL listed mark, LPS. The power supply must meet any safety and compliance requirements for the country of use.

The NI 177x Smart Camera uses a nominal 24 VDC power source. The device accepts power within the range of 24 V ±10% with an additional allowance for an AC peak of +5%. Refer to Appendix A, *Specifications*, for complete power requirement specifications.

### 100/1G Connector

The 100/1G connector is an 8-pin female connector that provides Ethernet communication capabilities at 10 Mbit/sec, 100 Mbit/sec, or 1 Gbit/sec (1000 Mbit/sec). The pinout of this connector follows the 100/1000 BaseT Ethernet standard found in the IEEE 802.3-2002 standard.

Connecting Lighting and External Devices

This chapter provides information about connecting the NI 177x Smart Camera to external devices, including external lighting and triggering devices.

Connecting Lighting Devices

To connect a light directly to the NI 177x Smart Camera, connect the LED_DRV signal to the positive terminal on the lighting device. Connect the ground of the NI 177x Smart Camera and the lighting device to a common ground.

The controlled current output sources current for a LED lighting device. You can control the amount of current by specifying a value between 0 and 500 mA, in 256 steps.

To configure a light, you can enter the lighting data manually in MAX or Vision Builder AI:

- **MAX**—Select the Lighting tab of the NI Smart Camera configuration page and click Configure Light. The light must be configured in MAX before you can use it in LabVIEW.

- **Vision Builder AI**—Select the Lighting tab of the Acquire Image (Smart Camera) step and click Configure Light.

Connecting a Light Controller

You can connect a light controller to the NI 177x Smart Camera in order to control any connected lighting devices.

**Caution**  The controlled current output is an unregulated output dependent on the range of the power supply provided to the device. If the power provided to the device is ±10% with +5% AC ripple, the controlled current output could be as high as 27.6 V. If the provided power exceeds the input voltage specifications of the third-party lighting controller, do not connect the controlled current output to the controller to prevent damage to the controller. Use a power supply with tolerances that meet the requirements of the controller.
To connect a lighting controller, connect the OUT1 signal to the digital input signal of the lighting controller. The OUT1 signal is an unmodulated signal that can turn the lighting controller on or off. Connect the ground of the NI 177x Smart Camera and the lighting controller to a common ground. Refer to Figure 4-1 and for wiring examples.

Note Each open collector output can sink up to 100 mA.

---

**Figure 4-1.** Connecting to an External Light Controller
Open Collector Outputs

You can wire an open collector output to both sourcing and sinking output devices. Refer to Figures 4-2 and 4-3 for wiring examples by output type. Refer to Appendix A, Specifications, for current requirements.

Connecting to a NPN Device

Connect the ground of the NI 177x Smart Camera and the NPN input device to a common ground.

Note Each open collector output can sink up to 100 mA.
Connecting to a PNP Device

Because a PNP input device requires a sourcing input, you must use an external pull-up resistor. Note that the resistor will invert the output signal so that the open collector output disables the PNP input device.

Connect the ground of the NI 177x Smart Camera and the PNP input device to a common ground.

Note Each open collector output can sink up to 100 mA.

![Diagram of connecting to an external PNP input device]

Protecting Against Inductive Loads

When an inductive load, such as a relay or solenoid, is connected to an output, energy stored in the inductor may cause a voltage spike when power is removed. This flyback voltage can damage the outputs and the power supply.

The Power & I/O Accessory for NI 177x Smart Cameras (781993-01) includes integrated flyback diodes so that no additional wiring is required.

If you are not using the Power & I/O Accessory for NI 177x Smart Cameras, you must install a flyback diode to limit flyback voltages at the inductive load. Mount the flyback diode as close to the load as possible.
Use this protection method if you connect any of the open collector outputs directly to an inductive load.

Connect the NI 177x Smart Camera output and the negative side of the load to the diode anode and connect the positive side of the load to a +24 V power supply and the diode cathode, as illustrated in Figure 4-4.

Connect the ground of the NI 177x Smart Camera and the inductive load device to a common ground.

**Note** Each open collector output can sink up to 100 mA.
Connecting to a Triggering Device

To connect to an external triggering device, connect the ground of the NI 177x Smart Camera to the ground of the triggering device. Connect the triggering device output to the NI 177x Smart Camera TRIG_IN+ input.

![Figure 4-5. Connecting to an External Triggering Device](image)

To wire a NI 177x Smart Camera output directly to the TRIG_IN+ input, you must add a pull up resistor to +24 V as illustrated in Figure 4-6. National Instruments recommends a 3 K-ohm, 1/4 W resistor. Wire the TRIG_IN– input to GND.

![Figure 4-6. Connecting to an External Triggering Device](image)
The Power & I/O Accessory for NI 177x Smart Cameras includes a +24 V output so that no additional wiring is required.

**Connecting to Serial Devices**

Use the RxD_RS232 and TxD_RS232 signals on the I/O connector for serial communication. Connect the RxD_RS232 signal on the NI 177x Smart Camera to the Tx signal on your serial device. Connect the TxD_RS232 signal on the NI 177x Smart Camera to the Rx signal on your serial device. Connect COM on the NI 177x Smart Camera to the ground of your serial device.

You must install the NI-Serial software on the NI 177x Smart Camera; it is not installed by default. Refer to the *Serial Hardware and Software Help* for information about installing the NI-Serial software on LabVIEW Real-Time targets, such as the NI 177x Smart Camera. To open this document, navigate to **Start»All Programs»National Instruments»NI-Serial»NI-Serial Help**.
This chapter provides an overview of the NI 177x Smart Camera image sensors, field of view, spectral response, and imaging settings. NI 177x Smart Cameras are available with the following image sensor configurations.

<table>
<thead>
<tr>
<th>Model</th>
<th>Resolution</th>
<th>Color Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>NI 1772</td>
<td>640 × 480 pixels (VGA)</td>

</tr>
<tr>
<td>NI 1776C</td>
<td>1,600 × 1,200 pixels (UXGA)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Refer to Appendix A, *Specifications*, for information about each image sensor.

**Field of View**

The field of view is the area under inspection that will be imaged by the NI 177x Smart Camera. It is critical to ensure that the field of view of your system includes the object you want to inspect.
To calculate the horizontal and vertical field of view (FOV) of your imaging system, use Equation 5-1 and the specifications for the image sensor of your device, as listed in Appendix A, Specifications.

\[
FOV = \frac{\text{Pixel Pitch} \times \text{Active Pixels} \times \text{Working Distance}}{\text{Focal Length}}
\]

(5-1)

where

- **FOV** is the field of view in either the horizontal or vertical direction,
- **Pixel Pitch** measures the distance between the centers of adjacent pixels in either the horizontal or vertical direction\(^1\),
- **Active Pixels** is the number of pixels in either the horizontal or vertical direction,
- **Working Distance** is the distance from the front element (external glass) of the lens to the object under inspection, and
- **Focal Length** measures how strongly a lens converges (focuses) or diverges (diffuses) light.

Figure 5-1 illustrates horizontal field of view and working distance.

---

\(^1\) Because NI 177x Smart Camera sensors have square pixels, *pixel pitch* corresponds to the pixel size for the appropriate sensor.
For example, if the working distance of your imaging setup is 100 mm, and the focal length of the lens is 8 mm, then the field of view in the horizontal direction of a NI 177x Smart Camera using the VGA sensor is

\[
FOV_{\text{horizontal}} = \frac{0.0074 \text{ mm} \times 640 \times 100 \text{ mm}}{8 \text{ mm}} = 59.2 \text{ mm} \quad (5-2)
\]

Similarly, the field of view in the vertical direction is

\[
FOV_{\text{vertical}} = \frac{0.0074 \text{ mm} \times 480 \times 100 \text{ mm}}{8 \text{ mm}} = 44.4 \text{ mm} \quad (5-3)
\]

Based on the result of Equations 5-2 or 5-3, you can see that you might need to adjust the various parameters in the FOV equation until you achieve the right combination of components that match your inspection needs. This might include increasing your working distance, choosing a lens with a shorter focal length, or changing to a high resolution camera.

**Image Sensor Spectral Response**

The spectral response curve describes the relative sensitivity of the sensor to different wavelengths of light. If you are imaging a dim scene, this information can be useful when selecting a light source to use in your application as the camera is most sensitive at its peak responsiveness. It also helps determine if your application might require filters to remove undesired wavelengths of light from the scene.

Refer to Appendix A, *Specifications*, to find the normalized spectral response curves for each image sensor.

**Gain**

Gain is a multiplier applied to the analog signal prior to digitization. Increasing the gain increases the amplitude of the signal. Gain allows you to trade off between making smaller signals more visible at the cost of increased noise and no longer being able to differentiate between larger signals. For most applications, the NI 177x Smart Camera default gain setting optimizes the balance between small signals and large signals.
Figure 5-2 shows what happens when gain is applied to a signal.

![Figure 5-2. Effect of Gain on the Video Signal](image)

In Figure 5-2a, low gain has been applied to the signal. The pixel values in the image are grouped close together. In Figure 5-2b, medium gain has been applied to the signal; there are now more notable differences in pixel value within the image. In Figure 5-2c, high gain has been applied to the signal; at high gain, mid-range and bright portions of the image are now both represented as white, the highest pixel value. In Figure 5-2c, several bright areas of the image have been clipped to the maximum pixel value, and you can no longer distinguish subtle shading in the brightest areas of the image.

Gain can be useful when there is not enough available light and you need to increase the brightness of your images. However, increasing gain multiplies both the signal and noise. When possible, it is preferable to add additional lighting.

**Auto White Level (NI 177xC Smart Cameras)**

NI 177xC Smart Cameras allow you to adjust the gain for each color plane in the RGB color space. The white level specifies the point at which values in the red, green, and blue color planes converge to produce white. To obtain an accurate white level, either adjust each gain value manually or use automatic white level adjustment with a test image. For best results the image should contain a neutral reference, such as a gray piece of paper or a reference card.
There are multiple ways to adjust gain values or enable automatic white balance adjustment:

- **MAX**—Use the settings on the **Color** tab of the device configuration page to adjust gain levels or enable automatic white level adjustment.
- **Vision Builder AI**—Use the settings on the **Color** tab of the **Acquire Image (Smart Camera)** step to adjust gain levels or enable automatic white level adjustment.

## Black Level (NI 177xC Smart Cameras)

The black level specifies the image brightness. Set the black level to the pixel value which corresponds to true black. If the black level is inaccurate, near-black pixels may be displayed as black or black objects may appear gray in the output image.

There are multiple ways to adjust gain values or enable automatic white balance adjustment:

- **MAX**—Use the settings on the **Camera Attributes** tab of the device configuration page.
- **Vision Builder AI**—Use the settings on the **Advanced** tab of the **Acquire Image (Smart Camera)** step.

## Look-Up Table

A look-up table (LUT) transformation maps pixel values in the source image into other values in the transformed image. For example, you can use a LUT transformation to improve the contrast and brightness of an image.

**Note** NI 177xC Smart Cameras allow you to define a LUT for each color plane in the RGB color space.

To enable a LUT in MAX, use the **LUT Controls** on the **Camera Attributes** tab of the device configuration page.

Refer to the *NI Vision for LabVIEW Basics Help* for information about using a LUT transformation to improve images in LabVIEW. To open this document, navigate to **Start»All Programs»National Instruments»Vision»Documentation»NI Vision**.

**Note** Vision Builder AI does not support LUT editing for NI 177x Smart Cameras.
Maintenance

Do not touch the CCD sensor by hand or with other objects. The sensor can be damaged by electrostatic discharge (ESD), body oils, and particulate matter.

Use a lens mount cover whenever a lens is not mounted on the camera to protect the sensor from dust and dirt.

Avoid drastic temperature changes to prevent dew condensation.

When necessary, use the following procedure to clean the sensor at a workstation equipped with anti-ESD facilities. If dust sticks to the CCD, first attempt to blow it off from the side of the sensor using ionized air. If oils are present on the sensor, clean the sensor with a cotton bud and ethyl alcohol. Be careful not to scratch the glass. Use only one pass over the glass per cotton bud to minimize the risk of recontamination and scratching.
This chapter contains information about acquiring images with the NI 177x Smart Camera and explains the relationships between triggering, lighting, and exposure.

**Exposure**

The NI 177x Smart Camera provides control of the image sensor exposure time through software. The exposure time is the amount of time that light is allowed to strike the sensor to produce an image. When light strikes the surface of the sensor, it dislodges electrons. As more light strikes the sensor, more electrons are freed, creating a charge on the sensor.

For a given amount of light, the sensor collects more charge during a longer exposure time than a shorter exposure time. Because the charge is what is read out to produce the image, it is important to have an optimal amount of light and exposure time for your application.

Exposing the image sensor for too short of a time relative to the amount of light in the environment results in a dark, low contrast image. Exposing the image sensor for too long of a time relative to the amount of light in the environment results in a bright, low contrast image. When the image sensor is exposed for an appropriate amount of time relative to the light in the environment, acquired images will exhibit appropriate contrast to easily distinguish both dark and light features. Contrast is a key factor in obtaining good results from image processing algorithms.

In applications where the object under inspection is moving, the exposure time must be carefully considered. If the object moves significantly during the exposure, the resulting image is blurry and unsuitable for processing.

The maximum exposure time for imaging a moving object without blurring depends on the per pixel spatial resolution and the rate of motion of the object. The per pixel spatial resolution is the field of view, calculated in the *Field of View* section of Chapter 5, *Image Sensor*, divided by the number of pixels in the sensor. Together, this information can be used to calculate the maximum exposure. Assuming the object is moving...
horizontally across the field of view, use Equation 6-1 to calculate the maximum exposure time.

\[
E_{\text{max}} = \frac{R_{\text{Horizontal}} \times 2}{(FOV_{\text{Horizontal}})/(N_{\text{Horizontal}})}
\]  

(6-1)

where  
- \( E_{\text{max}} \) is the maximum exposure time without blurring,
- \( R \) is the rate of motion of the object either horizontally or vertically,
- \( FOV \) is the field of view in the direction of motion, and
- \( N \) is the number of sensor pixels in the direction of motion

For many applications that include moving objects, additional lighting is necessary to achieve good image contrast due to the short exposure time required to avoid motion blur.

Additionally, in many environments, the ambient light conditions vary too significantly to obtain consistent results without adding dedicated lighting. For example, in a building with windows, the ambient light can vary significantly with weather. Also, standard fluorescent lighting flickers at a rate that is perceivable by the NI 177x Smart Camera. In these situations, the ambient light must be overridden with a dedicated light source to ensure reproducible results.

**Acquiring Images**

You can configure the NI 177x Smart Camera to acquire images based on internal timing or an external trigger signal. In both cases, the NI 177x Smart Camera can acquire images at the camera’s maximum frame rate. Refer to the *Maximum Frame Rate* section for information about factors that affect the maximum frame rate.

**Internal Timing**

The NI 177x Smart Camera features two types of internally-timed modes: free-run mode and fixed-frame-rate mode.

In free-run mode, the device acquires images at the maximum frame rate allowed by the configuration.

In fixed-frame-rate mode, you can specify a frame rate that is less than or equal to the maximum frame rate.
External Trigger

Use the trigger input to synchronize the NI 177x Smart Camera with an external event, such as the assertion of a signal generated by a proximity sensor. You can trigger the NI 177x Smart Camera at rates up to the maximum frame rate. Refer to the Maximum Frame Rate section for information about factors that affect the maximum frame rate.

To use an external trigger, the trigger signal must be provided on the TRIG_IN+ and TRIG_IN– inputs to the camera and triggering must be enabled in the software. Refer to the Connecting to a Triggering Device section of Chapter 4, Connecting Lighting and External Devices, for information about connecting external signals.

You can enable triggering in the following software programs:

- **Vision Builder AI**—Select the Enable Trigger checkbox on the Trigger tab of the Acquire Image (Smart Camera) step.
- **LabVIEW**—Set the value of the TriggerSource attribute to External Trigger and set the value of the TriggerMode attribute to On.
- **MAX**—Select the Enable Trigger checkbox on the Triggering tab of the device configuration page.

Figure 6-1 illustrates the relationship between an external trigger, a lighting strobe, and the exposure time.
The trigger shown in Figure 6-1 represents an external trigger, configured to use the rising edge as the active edge. The time between the active edge of the trigger and the assertion of the lighting strobe is a user-configurable trigger delay. The trigger delay can be configured in either milliseconds or edge counts.

The amount of time required from the assertion of a trigger to the start of the light strobe and image exposure varies by application. For example, if a sensor that detects the presence of a part is positioned before the NI 177x Smart Camera on a conveyor belt, a trigger delay is required to ensure that the image is not exposed until the part to be inspected passes in front of the NI 177x Smart Camera. In this case, specifying the trigger delay in terms of edge counts allows the NI 177x Smart Camera to expose the image when the part is in position regardless of changes in conveyor belt speed. For other applications, a delay specified in milliseconds is sufficient.

If you are strobing a light, there is a delay of 500 $\mu$s while the lighting controller turns on the light.

After the lighting turn-on time, the exposure begins. The width of the exposure pulse determines how long the sensor is exposed. The exposure time can be adjusted by setting the Exposure Time control in Vision Builder AI, setting the ExposureTime attribute in LabVIEW, or by setting the Exposure Time control in MAX. The lighting strobe deasserts at the end of the exposure pulse. The end of an exposure starts the image readout from the sensor.

The maximum trigger rate is determined by the maximum frame rate for your configuration. Refer to the Maximum Frame Rate section for information about the factors that affect the maximum frame rate.
Maximum Frame Rate

Frame rate is the inverse of the frame period. The frame period is the time from the start of exposure on one frame to the start of exposure on the next frame, as shown in Figure 6-2.

![Figure 6-2. Frame Period](image)

The frame period is affected by the following factors:

- Exposure time, as described in the Exposure section of this chapter
- Trigger delay, as described in the External Trigger section of this chapter

Determining the Maximum Frame Rate

You can determine the maximum frame rate for your configuration in software by reading the Max Frame Rate indicator in Vision Builder AI, reading the AcquisitionFrameRateLimit attribute in LabVIEW, or reading the Max Frame Rate indicator in MAX.

When external triggering is enabled, do not trigger faster than the maximum frame rate. If a trigger occurs faster than the maximum frame rate, the camera exhibits the following behavior. If an incoming trigger is received during exposure, the incoming trigger is ignored. If an incoming trigger is received during readout, the trigger is delayed until readout concludes.
Use Equation 6-2 to understand how software determines the maximum frame rate:

\[
\text{max frame rate} = \frac{1}{\text{min frame period}} \tag{6-2}
\]

where \( \text{min frame period} \) is the minimum amount of time for the strobe and trigger mode, as described in the Calculating the Minimum Frame Period section.

**Determining the Exposure Time**

The minimum frame period depends on exposure time, lighting mode, and trigger delay.

A longer exposure time results in a longer frame period, and a slower maximum frame rate.

**Determining the Trigger Delay**

If the trigger delay is set longer than the untriggered minimum frame period, the trigger delay value further limits the \( \text{min frame period} \). When the trigger delay is specified in milliseconds, the software includes this in the calculation of the maximum frame rate indicator.

**Calculating the Minimum Frame Period**

Refer to Equations 6-3 and 6-4 to calculate the minimum frame period for untriggered acquisitions with and without strobing.

\[
\text{min frame period}_{\text{NoStrobeNoTrigger}} = T + L + E \tag{6-3}
\]

\[
\text{min frame period}_{\text{WithStrobeNoTrigger}} = T + L + E + R \tag{6-4}
\]

Refer to Equations 6-5 and 6-6 to calculate the minimum frame period for triggered acquisitions with and without strobing.

\[
\text{min frame period}_{\text{NoStrobeWithTrigger}} = \max(T + L + E, \text{Trigger Delay}) \tag{6-5}
\]

\[
\text{min frame period}_{\text{WithStrobeWithTrigger}} = \max(T + L + E + R, \text{Trigger Delay}) \tag{6-6}
\]

where \( T \) is the trigger synchronization variability,

\( L \) is the lighting turn-on time,

\( E \) is the exposure time, and

\( R \) is the image readout duration.
This chapter provides information about the location and functionality of the LED indicators on the NI 177x Smart Camera.

Understanding the LED Indicators

The NI 177x Smart Camera includes four multicolor indicators. The following figure illustrates the location of the LED indicators:
Device Initialization

While the NI 177x Smart Camera initializes, the Power and Status LED indicators exhibit behavior described in the following table:

<table>
<thead>
<tr>
<th>Indicator Name</th>
<th>LED Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power</td>
<td>Red for 0.5 seconds then solid green</td>
</tr>
<tr>
<td>Status</td>
<td>Red for 0.5 seconds then off</td>
</tr>
</tbody>
</table>

If both the Power and Status indicators continuously display solid red, your device has experienced a critical error and you should contact NI support.

Power Indicator

The Power indicator provides information about the power supply. The Power indicator is green while the camera is properly powered on. When no power is being supplied to the NI Smart Camera, the Power indicator is unlit. When power is first applied to the device, the Power indicator flashes red for one second while internal systems power up. If the Power indicator stays red for longer than one second, it indicates that the voltage is out of range.

Status Indicator

The Status indicator provides information about the status of the camera. The following table describes the behavior of the Status indicator:

<table>
<thead>
<tr>
<th>LED Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>The camera has no power or software is not installed.</td>
</tr>
<tr>
<td>Red</td>
<td>The camera is initializing.</td>
</tr>
<tr>
<td>Orange</td>
<td>Software initialized successfully and is ready for use.</td>
</tr>
<tr>
<td>Green</td>
<td>The camera is acquiring an image.</td>
</tr>
</tbody>
</table>
The NI 177x Smart Camera indicates specific conditions by flashing the Status indicator, as described in the following table:

<table>
<thead>
<tr>
<th>LED Behavior</th>
<th>LED Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solid</td>
<td>Orange</td>
<td>Software initialized successfully and is ready for use.</td>
</tr>
<tr>
<td>1 Flash</td>
<td>Orange</td>
<td>The NI 177x Smart Camera is configured for DHCP and no DHCP server is available. Use MAX or Vision Builder AI to configure the NI 177x Smart Camera.</td>
</tr>
<tr>
<td>2 Flashes</td>
<td>Orange</td>
<td>The NI 177x Smart Camera detects an error in the software configuration. This usually occurs when an attempt to upgrade the software is interrupted or if system files are deleted from the NI 177x Smart Camera. Reinstall software on the NI 177x Smart Camera.</td>
</tr>
<tr>
<td>3 Flashes</td>
<td>Orange</td>
<td>The NI 177x Smart Camera is in safe mode. Safe mode is enabled when the SAFE_MODE signal is connected and grounded.</td>
</tr>
<tr>
<td>4 Flashes</td>
<td>Orange</td>
<td>The NI 177x Smart Camera has experienced two consecutive software exceptions. The NI 177x Smart Camera automatically restarts after an exception. After the second exception, the NI 177x Smart Camera remains in the exception state, alerting you to resolve the problem. Reinstall software on the NI 177x Smart Camera or contact National Instruments for assistance.</td>
</tr>
</tbody>
</table>

**User Indicator**

The User indicator is a user-configurable LED. For example, you can use the indicator to indicate the PASS/FAIL status of an inspection. Configure the LED through the **UserLEDState** attribute in LabVIEW or the **Read/Write I/O** step in Vision Builder AI.
100/1G Indicator

The 100/1G indicator is a multicolor LED that indicates the status of any network connection. The following table describes the behavior of the 100/1G indicator:

<table>
<thead>
<tr>
<th>LED Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>No link or a 10 Mbps link is negotiated</td>
</tr>
<tr>
<td>Yellow</td>
<td>A 100 Mbps link is negotiated</td>
</tr>
<tr>
<td>Green</td>
<td>A 1,000 Mbps link is negotiated</td>
</tr>
</tbody>
</table>

A blinking LED indicates network activity.
Mounting Information

This chapter provides information about mounting the NI 177x Smart Camera or attaching a light mount.

⚠️ **Caution**  If you choose not to mount the NI 177x Smart Camera to a thermally conductive structure, do not position the device with the heat sinks resting on any surface. Doing so may violate the thermal requirements of the device and cause the device to overheat. Refer to Appendix A, *Specifications*, for temperature specifications.

Figures 8-1 through 8-4 provide the dimensional drawings necessary to create a custom mount for the NI 177x Smart Camera.
Figure 8-1. Front View of the NI 177x Smart Camera with Dimensions
Figure 8-2. Back View of the NI 177x Smart Camera with Dimensions
Figure 8-3. Bottom View of the NI 177x Smart Camera with Dimensions
Figure 8-4. Side View of the NI 177x Smart Camera with Dimensions
Specifications

The following specifications apply to these devices:

- NI 1772/1772C Smart Camera
- NI 1774/1774C Smart Camera
- NI 1776/1776C Smart Camera
- NI 1778 Smart Camera

These specifications are typical at 25 °C, unless otherwise stated.

Power Requirements

⚠️ **Caution**  Use the NI 177x Smart Camera only with a 12 W, 24 VDC ±10%, UL listed, limited power source (LPS) supply. The power supply should bear the UL listed mark, LPS. The power supply must meet any safety and compliance requirements for the country of use.

Typical power consumption .................. 12 W 24 VDC, ±10%

Processing and Memory

- CPU ........................................................ Intel® Atom™ Z530 (1.60 GHz processor)
- DDR2 RAM ........................................... 512 MB
- Storage ................................................... 2 GB solid state

Opto-Coupled Inputs

- Channels ................................................. 4
- Input type ............................................. Opto-coupled
- Input current ........................................ 1.6 mA
- On voltage level ................................. Greater than 15 V
- Off voltage level ................................. Less than 0.8 V
Appendix A Specifications

On current (minimum)......................0.5 mA
Off to on responsiveness..............5 μs
On to off responsiveness...............25 μs

**Open Collector Outputs**

Channels ........................................4
Output type .....................................Open collector
Operating voltage range ..................24 V (max)
Sinking current range .....................0 to 100 mA
Maximum current leakage ...............10 μA
On voltage drop .............................25 mV
Maximum inrush current .................4 A for 300 μs (max)
Off to on responsiveness..............250 ns
On to off responsiveness...............250 ns

**Controlled Current Output**

Operating voltage .........................24 V
Output voltage ..............................2.4 to 21 V
Output current range .....................0 to 500 mA

**Network**

Connector ..................................8-pin female M12
Network interface .........................Ethernet
Speed ........................................10; 100; 1,000 Mbps
Duplex .......................................Full, half
Speed autodetection ....................Yes
Duplex autodetection ....................Yes
Auto MDI/MDI-X correction .......... Yes
DHCP Support ................................. Yes

Serial

Baud rates ...................................... Up to 115.2 Kbps
Default baud rate ......................... 9,600 bps
Hardware flow control ..................... No

Image Sensor

All NI 177x Smart Cameras use a progressive scan CCD sensor. The following table describes sensor characteristics for each camera.

Table A-1. NI 177x Smart Camera Sensor Characteristics

<table>
<thead>
<tr>
<th>Camera Model</th>
<th>Sensor</th>
<th>Optical Format (in.)</th>
<th>Active Pixels</th>
<th>Pixel Size (µm)</th>
<th>Maximum Usable Frame Rate (fps)</th>

- Camera housing...................................... Painted aluminium
- Dimensions (without lens cover) ........... 11 cm × 7.5 cm × 4.98 cm
  (4.33 in. × 2.95 in. × 1.96 in.)

**Environmental**

- The NI Smart Camera is intended for indoor use only.
- Operating ambient temperature........... 0 to 50 °C
- Humidity ............................................... 10% to 90% RH, noncondensing
- IP rating............................................... 67
- Pollution degree ................................. 2
Appendix A Specifications

Operating shock (IEC 60068-2-27) ............... 50 g, 3 ms half sine, 18 shocks at 6 orientations; 30 g, 11 ms half sine, 18 shocks at 6 orientations

Operating vibration
Random (IEC 60068-2-34) .................. 10 Hz to 500 Hz, 5 Grms
Swept sine (IEC 60068-2-6) .............. 10 Hz to 500 Hz, 5 g

Approved at altitudes up to 2,000 m.

Note For UL and other safety certifications, refer to the product label or visit ni.com/certification, search by model number or product line, and click the appropriate link in the Certification column.

Electromagnetic Compatibility

NI 177x Smart Cameras meet the following EMC standards for information technology equipment:
- EN 55022 Emissions; Group 1, Class A
- EN 55024 Immunity; Basic Levels
- CE, C-Tick, ICES, and FCC Part 15 Emissions; Class A

CE Compliance

NI 177x Smart Cameras meet the essential requirements of applicable European Directives, as amended for CE marking, as follows:
- 2004/108/EC; Electromagnetic Compatibility Directive (EMC)

Note Refer to the Declaration of Conformity (DoC) for this product for any additional regulatory compliance information. To obtain the DoC for this product, visit ni.com/certification, search by model number or product line, and click the appropriate link in the Certification column.
Environmental Management

NI is committed to designing and manufacturing products in an environmentally responsible manner. NI recognizes that eliminating certain hazardous substances from our products is beneficial to the environment and to NI customers.

For additional environmental information, refer to the *NI and the Environment* Web page at ni.com/environment. This page contains the environmental regulations and directives with which NI complies, as well as other environmental information not included in this document.

Waste Electrical and Electronic Equipment (WEEE)

**EU Customers** At the end of the product life cycle, all products must be sent to a WEEE recycling center. For more information about WEEE recycling centers, National Instruments WEEE initiatives, and compliance with WEEE Directive 2002/96/EC on Waste and Electronic Equipment, visit ni.com/environment/weee.

**电子信息产品污染控制管理办法 （中国 RoHS）**

中国客户 National Instruments 符合中国电子信息产品中限制使用某些有害物质指令 (RoHS)。关于 National Instruments 中国 RoHS 合规性信息，请登录 ni.com/environment/rohs_china。 (For information about China RoHS compliance, go to ni.com/environment/rohs_china.)
The following table provides a partial list of the available NI 177x Smart Camera attributes for use in LabVIEW applications.

### Table B-1. Camera Attributes

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Data Type</th>
<th>Range</th>
<th>Unit</th>
<th>Description</th>

Visit the following sections of the award-winning National Instruments Web site at ni.com for technical support and professional services:

- **Support**—Technical support at ni.com/support includes the following resources:
  - **Self-Help Technical Resources**—For answers and solutions, visit ni.com/support for software drivers and updates, a searchable KnowledgeBase, product manuals, step-by-step troubleshooting wizards, thousands of example programs, tutorials, application notes, instrument drivers, and so on. Registered users also receive access to the NI Discussion Forums at ni.com/forums. NI Applications Engineers make sure every question submitted online receives an answer.
  - **Standard Service Program Membership**—This program entitles members to direct access to NI Applications Engineers via phone and email for one-to-one technical support, as well as exclusive access to eLearning training modules at ni.com/eLearning. NI offers complementary membership for a full year after purchase, after which you may renew to continue your benefits.

For information about other technical support options in your area, visit ni.com/services, or contact your local office at ni.com/contact.

- **Training and Certification**—Visit ni.com/training for training and certification program information. You can also register for instructor-led, hands-on courses at locations around the world.

- **System Integration**—If you have time constraints, limited in-house technical resources, or other project challenges, National Instruments Alliance Partner members can help. To learn more, call your local NI office or visit ni.com/alliance.
• **Declaration of Conformity (DoC)**—A DoC is our claim of compliance with the Council of the European Communities using the manufacturer’s declaration of conformity. This system affords the user protection for electromagnetic compatibility (EMC) and product safety. You can obtain the DoC for your product by visiting [ni.com/certification](http://ni.com/certification).

You also can visit the Worldwide Offices section of [ni.com/niglobal](http://ni.com/niglobal) to access the branch office Web sites, which provide up-to-date contact information, support phone numbers, email addresses, and current events.

</table>

A

active pixels The number of light-sensitive pixels on a CCD sensor.

B

black level The value that corresponds to true black in the image.

C

CCD Charge Coupled Device. A chip that converts light into electronic signals.

E

edge count A specified number of assertions, rising, falling, or both, in a signal.

exposure time The amount of time that light is allowed to strike the imaging sensor to produce an image.
### Glossary

**F**
- **falling edge**
  - The digital signal transition from the high state to the low state.
- **field of view**
  - The area of inspection that the camera can acquire.
- **fps**
  - Frames per second.

**G**
- **gain**
  - The amount of increase in signal power, voltage, or current expressed as the ratio of output to input.

**I**
- **IEC**
- **IEEE**
  - Institute of Electrical and Electronics Engineers. A standard-setting body.
- **I/O**
  - Input/output. The transfer of data to/from a computer system involving communications channels, operator interface devices, or data acquisition and control interfaces.

**L**
- **LED**
  - Light-emitting diode.
- **lookup table**
  - Maps pixel values in a source image to other values in a transformed image.

**M**
- **MAX**
  - Measurement & Automation Explorer. A controlled, centralized configuration environment that allows you to configure all of your NI devices.
- **megapixel**
  - 1 million pixels. NI 177x Smart Cameras with a 5 MP sensor feature a resolution of 2,448 × 2,050.
- **MP**
  - Megapixel.
N
NI-IMAQdx  Driver software for National Instruments image acquisition devices and NI 177x Smart Cameras. NI-IMAQdx is installed as part of NI Vision Acquisition Software.

O
open collector  An output mechanism that grounds or does not ground a connection to a powered device. An open collector output cannot supply voltage.
opto-coupled  Optically coupled.
optically coupled  An input mechanism that provides current protection by using a light emitter to transmit signals to a light receiver, which then enables a signal current.

P
pixel pitch  The distance between the centers of adjacent pixels in either the horizontal or vertical direction.
PLC  Programmable Logic Controller. An industrial computer used for factory automation, process control, and manufacturing systems.
pulse train  A signal consisting of a series of continuous pulses.

R
reference card  An object of a solid, neutral color (typically gray) in the image which functions as a reference during image correction.
rising edge  The digital signal transition from the low state to the high state.
RS-232  Standard electrical interface for serial data communications.
Glossary

S

sensor resolution The number of columns and rows of CCD pixels in the camera sensor.
sensor size The size of the active area of an image sensor.
sinking A device that requires a powered signal as an input.
sourcing A device that provides a powered signal.
spectral response The ability of a sensor to detect light expressed as a value between 0 and 1 for a given wavelength.
subnet A set of systems whose IP addresses are configured such that they can communicate directly with one another. Data will not flow through an intermediate router.
SXGA sensor Super eXtended Graphics Array. SXGA may refer to multiple resolutions. SXGA sensors used with NI 177x Smart Cameras feature a resolution of $1,280 \times 960$ pixels.
syntax Set of rules to which statements must conform in a particular programming language.

T

TCP Transmission Control Protocol. A set of standard protocols for communicating across a single network or interconnected set of networks. TCP is for high-reliability transmissions.
trigger Any event that causes or starts some form of data capture.
trigger delay The time between the active edge of a trigger and the assertion of a lighting strobe.

U

UXGA sensor Video Graphics Array sensor. Image sensor that features a resolution of $1,600 \times 1,200$ pixels.
