Definitions

Warranted specifications describe the performance of a model under stated operating conditions and are covered by the model warranty. *Warranted* specifications account for measurement uncertainties, temperature drift, and aging. *Warranted* specifications are ensured by design, or verified during production and calibration.

Characteristics describe values that are relevant to the use of the model under stated operating conditions but are not covered by the model warranty.

- *Typical* specifications describe the performance met by a majority of models.
- *Nominal* specifications describe an attribute that is based on design, conformance testing, or supplemental testing.
- *Measured (meas)* specifications describe the measured performance of a representative model.

Specifications are *Typical* unless otherwise noted.

Conditions

Specifications are valid under the following conditions unless otherwise noted.

- All filter settings
- All impedance selections
- Sample clock set to 100 MS/s

External Sample Clock

Source	CLK IN (front panel SMB connector)
--------	------------------------------------

¹⁴ Internal Sample clock is locked to the Reference clock or derived from the onboard VCXO.

¹⁵ In normal operation mode (non-OSP mode), divide by n decimation is used for all rates less than 100 MS/s. Non-OSP decimation does not protect the acquired data from undersampling aliasing. Non-OSP decimation and OSP decimation are mutually exclusive.

¹⁶ 10 MHz input signal.

¹⁷ Includes the effects of the converter aperture uncertainty and the clock circuitry jitter. Excludes trigger jitter.

Onboard Signal Processing (OSP)

Figure 5. PCI-5142 Onboard Signal Processing Block Diagram

Note To use onboard signal processing (OSP) on the PCI-5142, the DDC Enabled property/attribute must be set to TRUE.

²⁷ It is possible to exceed these numbers if you fetch records while acquiring data.

The following four OSP operations are available:

- Send one IF signal to CH 0 and perform quadrature downconversion on the signal (complex data is returned).
- Send I and Q baseband signals to CH 0 and CH 1 and perform alias-protected decimation (complex data is returned).
- Send a signal to CH 0 and perform alias-protected decimation (real data is returned).
- Send a signal to CH 0 and perform real downconversion on the signal (real data is returned).

Number of digital downconverters (DDCs)	1
Data processing modes ²⁸	Real (I path only) Complex (IQ)
OSP decimation range ²⁹	1, 2, 4, 6, 8, 10 12 to 4,096 (multiples of 4) 4,096 to 8,192 (multiples of 8) 8,192 to 16,384 (multiples of 16)
Sample rate range ³⁰	
Internal Sample clock timebase	6.1 kS/s to 100 MS/s (real or complex)
External Sample clock timebase	Sample clock timebase/OSP decimation
Real flat bandwidth	$0.4 \times \text{Sample Rate}$
Complex flat bandwidth ³¹	$0.8 \times \text{Sample Rate}$

Digital Gain and Offset

Digital gain and offset resolution	18 bits
Digital gain range	-1.5 to +1.5 Values < 1 attenuate user data
Digital offset range	($-0.4 \times \text{Vertical Range}$) to ($+0.4 \times \text{Vertical Range}$) ³²
Output	(ADC Data \times Digital Gain) + Digital Offset. ³³

²⁸ Complex mode is used for both IQ baseband decimation and quadrature downconversion.

²⁹ OSP decimation protects acquired data from high-frequency aliasing within the ADC Nyquist zone, whereas non-OSP decimation does not. Non-OSP decimation and OSP decimation are mutually exclusive.

³⁰ For sample rates less than 6.1 kS/s, use an external Sample clock or perform additional software decimation.

³¹ For example, complex bandwidth is 40 MHz with a complex sample rate of 50 MS/s.

³² Applied after digital gain.

³³ $(-0.5 \times \text{Vertical Range}) \leq \text{Output} \leq (+0.5 \times \text{Vertical Range})$

Numerically-Controlled Oscillator (NCO)

Frequency range ³⁴	
Internal Sample clock timebase	0 Hz to 50 MHz
External Sample clock timebase	0 Hz to (0.5 × Sample Clock Timebase)
Frequency resolution	
Internal Sample clock timebase	355 nHz
External Sample clock timebase	Sample Clock Timebase/2 ⁴⁸
I and Q phase resolution	0.0055 °
Tuning time	1 ms

Digital Performance

Maximum NCO spur	<-100 dBFS
Decimating filter passband ripple	<0.1 dB ³⁵
Decimating filter out-of-band suppression	>80 dB ³⁶

Waveform Acquisition Times

Table 18. Maximum Acquisition Time⁴⁹

Conditions	64 MB	256 MB
Sample rate = 100 MS/s, OSP disabled	0.336 s	1.34 s
Sample rate = 1 MS/s, real mode, OSP enabled	33.6 s	2 min 14 s
Sample rate = 100 kS/s, real mode, OSP enabled	5 min 36 s	22 min 22 s

Figure 6. Decimation Filter Frequency Response (Real Mode), 10 MS/s Sample Rate, Measured

⁴⁴ 1 V input range, 50 Ω input impedance, no analog filter. Demodulation, including resampling (sample rate conversion) and pulse shaping, done with the NI Modulation Toolkit on the host PC/controller. This is a measurement of system performance. The IQ Baseband generation was implemented with two TCik-synchronized NI PXI-5421 arbitrary waveform generators.

⁴⁸ 50 MS/s sample rate, 64 QAM modulation, 20 MSymbols/s, root raised cosine, alpha = 0.15

⁴⁹ For complex (IQ) mode, the acquisition time is halved.

Figure 10. 20 MSymbols/s 64 QAM, Measured⁵³

⁵² 1 V input range, 50 Ω input impedance, no analog filter, 25 MHz carrier, 25 MS/s sample rate, 32 QAM modulation, 6.92 MSymbols/s, root raised cosine, alpha = 0.15.

⁵³ 1 V input range, 50 Ω input impedance, no analog filter, 25 MHz carrier, 50 MS/s sample rate, 64 QAM modulation, 20 MSymbols/s, root raised cosine, alpha = 0.15.

Calibration

External Calibration

External calibration calibrates the VCXO and the voltage reference. All calibration constants are stored in nonvolatile memory.

Self-Calibration

Self-calibration is done on software command. The calibration corrects for gain, offset, frequency response, triggering, and timing adjustment errors for all input ranges.

Calibration Specifications

Interval for external calibration	2 years
Warm-up time ⁵⁴	15 minutes

Software

Driver Software

Driver support for this device was first available in NI-SCOPE 3.0.

NI-SCOPE is an IVI-compliant driver that allows you to configure, control, and calibrate the PCI-5142. NI-SCOPE provides application programming interfaces for many development environments.

Application Software

NI-SCOPE provides programming interfaces, documentation, and examples for the following application development environments:

- LabVIEW
- LabWindows™/CVI™
- Measurement Studio
- Microsoft Visual C/C++
- .NET (C# and VB.NET)

Interactive Soft Front Panel and Configuration

When you install NI-SCOPE on a 64-bit system, you can monitor, control, and record measurements from the PCI-5142 using InstrumentStudio.

⁵⁴ Warm-up time begins after the NI-SCOPE driver is loaded.

InstrumentStudio is a software-based front panel application that allows you to perform interactive measurements on several different device types in a single program.

Note InstrumentStudio is supported only on 64-bit systems. If you are using a 32-bit system, use the NI-SCOPE-specific soft front panel instead of InstrumentStudio.

Interactive control of the PCI-5142 was first available via InstrumentStudio in NI-SCOPE 18.1 and via the NI-SCOPE SFP in NI-SCOPE 2.4. InstrumentStudio and the NI-SCOPE SFP are included on the NI-SCOPE media.

NI Measurement & Automation Explorer (MAX) also provides interactive configuration and test tools for the PCI-5142. MAX is included on the driver media.

Synchronization

Synchronization with the NI-TClk API⁵⁵

NI-TClk is an API that enables system synchronization of supported PXI modules in one or more PXI chassis, which you can use with the PCI-5142 and NI-SCOPE.

NI-TClk uses a shared Reference Clock and triggers to align the Sample Clocks of PXI modules and synchronize the distribution and reception of triggers. These signals are routed through the PXI chassis backplane without external cable connections between PXI modules in the same chassis.

Module-to-module skew, between PCI-5142 modules using NI-TClk⁵⁶

NI-TClk synchronization without manual adjustment ⁵⁷	
Skew, Peak-to-Peak ⁵⁸	500 ps
NI-TClk synchronization with manual adjustment ⁵⁷	
Skew after manual adjustment	≤5 ps
Sample Clock delay/adjustment resolution	≤5 ps

⁵⁵ NI-TClk installs with NI-SCOPE.

⁵⁶ Although you can use NI-TClk to synchronize non-identical modules, these specifications apply only to synchronizing identical modules. Specifications are valid under the following conditions:

- All modules installed in the same chassis.
- All filters are disabled.
- NI-TClk used to align the sample clocks of each module.
- All parameters set to identical values for each module.
- Self-calibration completed.
- Ambient temperature within ± 1 °C of self-calibration.

For other configurations, including multi-chassis systems, contact NI Technical Support at ni.com/support.

⁵⁷ Manual adjustment is the process of minimizing synchronization jitter and skew by adjusting Trigger Clock (TClk) signals using the instrument driver.

⁵⁸ Caused by clock and analog delay differences. Tested with a PXIe-1082 chassis with maximum slot to slot skew of 100 ps. Valid within ± 1 °C of self-calibration.

Power

Pollution Degree	2

Indoor use only.

Operating Environment

Ambient temperature range	0 °C to 45 °C (Tested in accordance with IEC 60068-2-1 and IEC 60068-2-2.)
Relative humidity range	10% to 90%, noncondensing (Tested in accordance with IEC 60068-2-56.)

Storage Environment

Ambient temperature range	-40 °C to 71 °C (Tested in accordance with IEC 60068-2-1 and IEC 60068-2-2.)
Relative humidity range	5% to 95%, noncondensing (Tested in accordance with IEC 60068-2-56.)

Compliance and Certifications

Safety Compliance Standards

This product is designed to meet the requirements of the following electrical equipment safety standards for measurement, control, and laboratory use:

- IEC 61010-1, EN 61010-1
- UL 61010-1, CSA C22.2 No. 61010-1

Note For UL and other safety certifications, refer to the product label or the [Product Certifications and Declarations](#) section.

Electromagnetic Compatibility

This product meets the requirements of the following EMC standards for electrical equipment for measurement, control, and laboratory use:

- EN 61326-1 (IEC 61326-1): Class A emissions; Basic immunity
- EN 55011 (CISPR 11): Group 1, Class A emissions
- EN 55022 (CISPR 22): Class A emissions
- EN 55024 (CISPR 24): Immunity
- AS/NZS CISPR 11: Group 1, Class A emissions
- AS/NZS CISPR 22: Class A emissions
- FCC 47 CFR Part 15B: Class A emissions
- ICES-001: Class A emissions

Note In the United States (per FCC 47 CFR), Class A equipment is intended for use in commercial, light-industrial, and heavy-industrial locations. In Europe, Canada, Australia, and New Zealand (per CISPR 11), Class A equipment is intended for use only in heavy-industrial locations.

Note Group 1 equipment (per CISPR 11) is any industrial, scientific, or medical equipment that does not intentionally generate radio frequency energy for the treatment of material or inspection/analysis purposes.

Note For EMC declarations, certifications, and additional information, refer to the [Product Certifications and Declarations](#) section.

CE Compliance

This product meets the essential requirements of applicable European Directives, as follows:

- 2014/35/EU; Low-Voltage Directive (safety)
- 2014/30/EU; Electromagnetic Compatibility Directive (EMC)
- 2011/65/EU; Restriction of Hazardous Substances (RoHS)

- 2014/53/EU; Radio Equipment Directive (RED)
- 2014/34/EU; Potentially Explosive Atmospheres (ATEX)
