Introduction

The National Instruments 9756 USB NOx Sensor Module Kit interfaces with NO\textsubscript{x} and O\textsubscript{2} exhaust gas sensors.

Features

- Configurable for one or two channels
- Measures NO\textsubscript{x} (ppm) and O\textsubscript{2} (%) concentrations
- Sensor controller supply voltage of 12 V to 16 V (24 V version available)
- Reverse battery protection on sensor controller module
Sensor controller harness
- Stand-alone executable that can run without a LabVIEW license
- Windows-based LabVIEW VIs

System Diagram

Hardware

The NI 9756 includes the following hardware:
- Continental UniNOx Smart NOx Sensor with an integrated sensor controller module
- Sensor bung
- Wiring harness
- NI USB-8473 USB High-Speed CAN module

The wiring harness in the NI 9756 connects to the NOx Sensor Control Module and splits into two cables for the NI USB-8473 module and an external power supply. The first cable connects to the NI USB-8473 with a female DB-9 connector. A terminating resistor of approximately 120 Ω is located inside this cable near the NOx Sensor Control Module and between the CAN High and CAN Low wires. The second cable provides three non-terminated leads for connecting to a power supply, which requires two leads, and for address selection of the NOx sensor module, which requires one lead.

Refer to the NI USB-8473 CAN Hardware and Software Manual for more information about cabling requirements.

Note: You must use the sensor included in the NI 9756 kit. NI does not support other sensors.
Powering the Hardware

The NI 9756 requires power from a range of 12 V to 16 V with a continuous current of 1.5 A and a peak current of 16 A. The maximum power requirement is 20 W, which typically occurs when the heating element is being turned on from a cold state. If you are using two sensors, double the capacity of the power supply.

Refer to the NI USB-8473 Hardware and Software Manual for more information on power requirements.

Contact National Instruments for more information about sensor specifications.

NOx Sensor Light-Off Times

Conditions
- Air T ......................................................... 25 ±5 °C
- BattV ......................................................... 14 V
- Heater ...................................................... ON

NOx .............................................................. <100 s
O₂ .............................................................. <80 s

NOx Sensor Preheating Function

When power is supplied to the sensor, the sensor enters preheating mode automatically until the Sensor Enable Boolean is set to TRUE within the supporting software. The Sensor Enable Boolean turns the internal sensor heater to its ON state. If the Sensor Enable Boolean is set to FALSE, the sensor returns to preheating mode. The preheating mode protects the sensor from mechanical cracks caused by water splash.

NOx Sensor Operating Temperature Ranges

Sensor Module Controller Temperature .......... -40 ºC to 105 ºC
(105 ºC to 115 ºC for a maximum of 10 minutes)

Storage temperature range ......................... -40 ºC to 120 ºC

Maximum storage time ................................... 2 years

Maximum exhaust gas temperature ............ 800 ºC (950 ºC for a maximum of 100 hours)

Maximum sensor hexagon screw temperature .................................. 620 ºC (650 ºC for a maximum of 100 hours)

Maximum sensor grommet temperature .......... 200 ºC (230 ºC for a maximum of 100 hours)

Preheating sensor temperature range .......... 80 ºC to 120 ºC

Lifespan approved by life cycle pattern .......... 2,000 hours or 120 K miles
NOx Sensor Electrical Characteristics

NOx Sensor Supply Voltage
Minimum supply voltage ......................... 12 V
Maximum supply voltage ....................... 16 V

NOx Sensor Supply Current
Average supply current ......................... 1.5A
Peak supply current at switch on .............. 16 A

Supply Power
Maximum supply power ........................ 20 W

NOx Sensor Miscellaneous
Thread torque ......................................... 50 N · m (36.88 lb · ft)
Lubrication............................................. Anti-seize compound

Figure 2. Installation Position

Figure 3. Tilt Angle in Gas Flow Direction
NOx Sensor Controller Module Connector

Type of connector ............................................. Hirschmann MLK 872-860-501
Number of pins ................................................ 5

Connector pin assignment
- Pin 1 ......................................................... Battery [red]
- Pin 2 ......................................................... Ground [black]
- Pin 3 ......................................................... CAN Low [blue]
- Pin 4 ......................................................... CAN High [orange]
- Pin 5 ......................................................... Address Switch [purple]

Pulling Pin 5 to ground changes the CAN transmit ID of the Sensor Control Module so that two NOx Sensor Control Modules can be added to the same network. Sensor Control Modules with Pin 5 floating are Ch. 1 and Sensor Control Modules with Pin 5 grounded are Ch. 2.

Wiring Harness

![Diagram](image)

**Figure 4. 2-Sensor Harness**

- Each leg from the junction is 4 ft
- Battery and Gnd wires are 18 AWG, CAN wires are 20 AWG
- 120Ω resistors across CAN-Low and CAN-High near sensor 1 and 2
- NI-CAN devices connect to the harness through a female DB-9 connector
- CAN-Ground is connected to Ground near junction
- Add. Sw should be connected to ground at the power supply
