CompactRIO System on Module

NI sbRIO-9651

- Integrated and fully validated middleware solution reduces design time and risk
- Industrial-grade Zynq-7020 All Programmable SoC with 220 DSP blocks
- Rugged design for long-term deployment in harsh, high temperature, high EMC environments
- Backed by NI’s 15-year hardware product lifecycle
- Deployment-ready Linux Real-Time OS with large set of validated drivers
- Development kit features a reference carrier board and design files for reuse
- Graphical development platform eliminates the need for HDL expertise to leverage reconfigurable hardware

Built for Accelerated Custom Embedded Design

The CompactRIO System on Module (SOM), based on the Xilinx Zynq All Programmable SoC, combines a fully tested and validated hardware design with a complete middleware solution and NI Linux Real-Time OS.

Unlike other SOMs, which offer limited deployment-ready software, the NI SOM integrates a validated board support package (BSP) and device drivers with the NI Linux Real-Time OS. As an alternative to hardware description languages (HDLs), LabVIEW system design software provides a graphical development environment with thousands of functions and IP blocks for both processor and FPGA logic development.

By leveraging a pre-validated hardware and software platform, you can focus your efforts on your core IP and minimize development time and risk for any embedded control or monitoring application.

### Detailed View of sbRIO-9651

- **Dedicated Processor I/O**
  - Gigabit Ethernet
  - USB Host
  - USB Host/Device
  - SDHC
  - Serial TX/RX (console out)

- **FPGA I/O**
  - 16 SE fixed at 3.3V
  - 144 SE/72 diff pairs with IO level selection
  - 3 Banks with user supplied voltage
  - Configurable Peripherals: Gigabit Ethernet, RS232 x3, RS485 x2, CAN x2
Key Features

Integrated and Validated Middleware Solution
The CompactRIO SOM is shipped with a complete and validated middleware solution, including NI Linux Real-Time, drivers, and support for multiple programming languages. The complete solution provides out-of-the-box support for peripherals such as USB or Ethernet, the communication interface between the processor and FPGA, and drivers to the onboard and C Series module I/O. The complete integrated software solution reduces the time and risk of a new project, and gives your team the ability to focus on the application development.

1,000+ Graphical Programming Functions
Easy-to-Use I/O API Libraries
Prebuilt Thread-Safe, Low-Level Drivers
NI Linux Real-Time
Ready to Run Out of the Box
Industry-Leading Silicon

Figure 1. Complete Deployment-Ready Software Stack

Heterogeneous Architecture
The CompactRIO SOM features an All-Programmable System on Chip (SoC) that contains two processing units: (1) a real-time processor for communication and signal processing and (2) an FPGA for implementing high-speed control and custom timing and triggering directly in hardware.

Processor
The Zynq-7020 contains a 66 MHz dual-core ARM Cortex-A9 processor for high performance with lower power consumption.

FPGA
The Artix-7 FPGA fabric (Zynq-7000 SoC) contains 85,000 logic cells and 220 DSP slices. With FPGA technology, you can implement more advanced control, signal processing, filtering, advanced timing, and other logic than ever before.

Figure 2. Use the heterogeneous architecture of CompactRIO to meet your processing needs.
Integrated Software

Define—and redefine—the functionality of your CompactRIO system with intuitive software, and use a single toolchain for every phase of your design cycle: from modeling and simulation, to prototyping and validation, to deployment and beyond. NI software reduces risk, enhances productivity, and eliminates the need to create and maintain I/O drivers, OSs, and other middleware.

![Image of software programming environment]

**Figure 3. Intuitive and Cohesive Software Programming Environment**

- **Reduced Development Time**
  Focus on solving problems, not low-level programming tasks, with built-in constructs to manage timing and memory in an intuitive programming environment.

- **Open Software Interoperability**
  Leverage other programming approaches alongside or within LabVIEW to reuse existing IP and take advantage of existing expertise.

- **Built-In Libraries**
  LabVIEW contains over 950 built-in signal processing, analysis, control, and mathematics functions to accelerate the development of embedded control and monitoring systems.

- **User-Programmable FPGA**
  Implement high-speed signal and image processing, custom timing and triggering, and control algorithms directly in hardware to maximize reliability and determinism.

- **Remote System Management**
  Transfer data between systems or remotely update hundreds of controllers at once with built-in system management utilities.

- **LabVIEW Tools Network**
  Extend the capabilities of your system with a vast ecosystem of certified, application-specific add-ons.
Leverage the Openness of NI Linux Real-Time: A Prebuilt, Validated RTOS

**Development Tool Options**
Program the real-time processor with LabVIEW, C/C++, or textual math and reuse code from past projects to save development time.

**Linux Ecosystem**
Access thousands of open-source applications, IP, and examples and collaborate with an active community of users and developers.

**Security**
Boost security and reliability with native support for Security-Enhanced Linux, which delivers mandatory access control through custom policy creation.

Figure 4. NI Linux Real-Time targets allow you to develop, deploy, and debug C/C++ code using Eclipse or your IDE of choice

Customize Programmable Hardware With LabVIEW FPGA
Take advantage of the graphical LabVIEW environment to program the onboard FPGA and unlock the incredible power of these devices—even without any knowledge of HDLs like VHDL or Verilog. The LabVIEW FPGA Module not only removes the requirement for HDL programming, but also eliminates the need to think through timing constraints, I/O configuration, and place and route settings, which are notoriously complex tasks.

- Built-in language constructs to manage clocks/timing, memory, I/O, and data transfer (DMA)
- Cycle-accurate simulation and debugging capabilities
- Cloud compile support to reduce compile times
- Support for HDL code integration
- Access to free IP for complex mathematics, high-speed control, image processing, signal analysis, and more in the FPGA IPNet community
Deployment-Ready Hardware

Modern, high-end embedded design is challenging. When you consider high clock-rate CPUs, FPGAs, complex DRAM interfacing, and high-density chips with high-speed analog and digital I/O, getting a product out the door that is certified for real-world, harsh industrial environments becomes more complicated.

NI embraces a demanding approach to how it designs, develops, validates, qualifies and certifies its products. By leveraging and re-using NI products, customers increase their efficiency while reducing costs, time, and risk and retain the capability to customize and innovate to differentiate themselves in the marketplace.

NI uses industry standards to validate, qualify, and certify its products. Its New Product Introduction process is certified for the ISO 9001 and ISO 14001 standards, and its CompactRIO Single-Board Controllers are certified as shown in Table 1.

In addition, all NI board-level controllers undergo the same test procedures as NI’s packaged controllers for shock and vibration, temperature, EMC, safety, and hazardous locations. Many of these certifications require an appropriate enclosure to obtain, but CompactRIO Single-Board Controllers have been tested to comply with these standards. Therefore, when you integrate CompactRIO Single-Board Controllers appropriately in your design, you can be confident that your end product is certifiable.
Development Kit Contents

Because the CompactRIO SOM requires custom hardware design, NI offers a development kit to help you accelerate your design cycle. This kit includes a reference carrier board, accessories, and over 70 pages of extensive documentation including reference board schematics as well as mechanical design documentation.

### Reference Carrier Board

The reference carrier board allows you to power on, configure, and begin application software development. It exposes all the available peripherals and provides the design files to integrate them in your own custom carrier board design.

The reference carrier board also features a digital prototyping area to communicate with specific chip sets as well as four PMOD connectors to help accelerate your I/O selection and integration in LabVIEW.
Platform-Based Approach to Control and Monitoring

What Is the CompactRIO Platform?
Every CompactRIO device is built on three pillars: productive software, reconfigurable hardware, and an expansive ecosystem. This results in a hardware platform that allows your business to standardize, customize, and accelerate productivity.

NI’s integrated run-time software, development environments, IP libraries, drivers, middleware, and enterprise and systems management tools, along with high-quality hardware and global services and support, provide the capabilities to meet your business needs.

Monetize Your Efforts
Focus on the core expertise of your business while leaving the foundational elements of your embedded design to NI. Spend time delivering innovation, competitive differentiation, and value add features to your customers by customizing a pre-built, pre-validated embedded system from NI. Get your equipment or machines shipping faster, with less engineering expense and risk, and more features.

Hardware Services

All NI hardware includes a one-year warranty for basic repair coverage, and calibration in adherence to NI specifications prior to shipment. PXI systems also include basic assembly and a functional test. NI offers additional entitlements to improve uptime and lower maintenance costs with service programs for hardware. Learn more at ni.com/services/hardware.

¹This option is only available for PXI, CompactRIO, and CompactDAQ systems.
²This option is not available for all products in all countries. Contact your local NI sales engineer to confirm availability.
³Expedited calibration only includes traceable levels.

PremiumPlus Service Program

NI can customize the offerings listed above, or offer additional entitlements such as on-site calibration, custom sparing, and life-cycle services through a PremiumPlus Service Program. Contact your NI sales representative to learn more.

Technical Support

Every NI system includes a 30-day trial for phone and e-mail support from NI engineers, which can be extended through a Software Service Program (SSP) membership. NI has more than 400 support engineers available around the globe to provide local support in more than 30 languages. Additionally, take advantage of NI’s award winning online resources and communities.
