

Manufacturer: National Instruments

Board Assembly Part Numbers (Refer to Procedure 1 for identification procedure):

| Part Number and Revision | Description |
|--------------------------|---|
| 157270C-0#L or later | NI 9216 Spring, 8-CH PT100 RTD 24-BIT, C Series Module |
| 158028C-0#L or later | NI 9216 DSUB, 8-CH PT100 RTD 24-BIT, C Series Module |
| 157643C-0#L or later | NI 9226 Spring, 8-CH PT1000 RTD 24-BIT, C Series Module |
| 158028C-0#L or later | NI 9226 DSUB, 8-CH PT1000 RTD 24-BIT, C Series Module |

Volatile Memory

| <i>Target Data</i> | <i>Type</i> | <i>Size</i> | <i>Battery Backup</i> | <i>User¹ Accessible</i> | <i>System Accessible</i> | <i>Sanitization Procedure</i> |
|-------------------------|-------------|-------------|-----------------------|------------------------------------|--------------------------|-------------------------------|
| Module configuration | CPLD RAM | 1 byte | No | Yes | Yes | Cycle Power |
| Module measurement data | CPLD RAM | 32 bits | No | Yes | Yes | Cycle Power |
| Calibration data | CPLD RAM | 8 bytes | No | No | Yes | Cycle Power |
| ADC configuration | ADC RAM | 1 byte | No | No | No | Cycle Power |
| ADC data | ADC RAM | 32 bits | No | No | No | Cycle Power |

Non-Volatile Memory (*incl. Media Storage*)

| <i>Target Data</i> | <i>Type</i> | <i>Size</i> | <i>Battery Backup</i> | <i>User Accessible</i> | <i>System Accessible</i> | <i>Sanitization Procedure</i> |
|--|-----------------------|-------------|-----------------------|------------------------|--------------------------|-------------------------------|
| Module ID and Calibration ² | EEPROM | 1KB | No | No | Yes | Procedure 2 |
| Module Operation | CPLD | 256LUTs | No | No | No | None |
| Isolation Common Mode compensation | Digital Potentiometer | 1 byte | No | No | No | None |

¹ Refer to *Terms and Definitions* section for clarification of *User* and *System Accessible*

Procedures

Procedure 1 – Board Assembly Part Number identification:

To determine the Board Assembly Part Number and Revision, look for the white label at the bottom of the module. The Assembly Part Number should be formatted as “#####<Rev Letter>-##L” (where ‘#’ are numbers).

Procedure 2 - Device Configuration EEPROM (Calibration Metadata):

The user-accessible areas of the Device Configuration EEPROM are exposed through a calibration Applications Programming Interface (API) in LabVIEW. Follow the instructions in KB [4GHLANQE](#) for changing the calibration password and clearing the user-defined information.

Terms and Definitions

Cycle Power:

The process of completely removing power from the device and its components and allowing for adequate discharge. This process includes a complete shutdown of the PC and/or chassis containing the device; a reboot is not sufficient for the completion of this process.

Volatile Memory:

Requires power to maintain the stored information. When power is removed from this memory, its contents are lost. This type of memory typically contains application specific data such as capture waveforms.

Non-Volatile Memory:

Power is not required to maintain the stored information. Device retains its contents when power is removed. This type of memory typically contains information necessary to boot, configure, or calibrate the product or may include device power up states.

User Accessible:

The component is read and/or write addressable such that a user can store arbitrary information to the component from the host using a publicly distributed NI tool, such as a Driver API, the System Configuration API, or MAX.

System Accessible:

The component is read and/or write addressable from the host without the need to physically alter the product.

Clearing:

Per *NIST Special Publication 800-88 Revision 1*, “clearing” is a logical technique to sanitize data in all User Accessible storage locations for protection against simple non-invasive data recovery techniques using the same interface available to the user; typically applied through the standard read and write commands to the storage device.

Sanitization:

Per *NIST Special Publication 800-88 Revision 1*, “sanitization” is a process to render access to “Target Data” on the media infeasible for a given level of effort. In this document, clearing is the degree of sanitization described.
